2021 SEMIANNUAL GROUNDWATER MONITORING AND CORRECTIVE ACTION REPORT

Atlantic Coast Consulting, Inc.

PROFESSIONAL CERTIFICATION

This *2021 Semiannual Groundwater Monitoring and Corrective Action Report*, Georgia Power Company – Grumman Road Private Industrial Landfill has been prepared in compliance with the Georgia Environmental Protection Division Rules for Solid Waste Management 391-3-4-.10 and 391-3-4-.14 by a qualified groundwater scientist or engineer with Atlantic Coast Consulting, Inc.

SUMMARY

This summary of the 2021 Semiannual Groundwater Monitoring and Corrective Action Report provides the groundwater monitoring and corrective action program status from July through December 2021 for Georgia Power Company (Georgia Power) Grumman Road Private Industrial Landfill (GRL). This summary was prepared by Atlantic Coast Consulting, Inc. (ACC) on behalf of Georgia Power.

GRL is located on Gulfstream Road, in Chatham County, Georgia, approximately 0.8 miles east of Savannah/Hilton Head International Airport and 1.3 miles west of the city of Port Wentworth. GRL received coal combustion residuals (CCR) from Georgia Power – Plant Kraft and operated under Georgia Environmental Protection Division (GA EPD) solid waste handling permit number 025-061D(LI). GRL is comprised of four cells or parcels: Parcel A [originally operated under permit number 025-034D(LI)], B1, B2, and B3.

Grumman Road Private Industrial Landfill

Groundwater at the site is monitored using a comprehensive monitoring system of wells installed to meet state monitoring requirements. Routine sampling and reporting began after background groundwater conditions were established in accordance with the Solid Waste Permit requirements specified in the Design and Operation (D&O) Plan. The monitoring program has been modified to include Appendix III and IV parameters to meet the requirements of the GA EPD Rules for Solid Waste Management 391-3-4-.10(6)(a) and 40 Code of Federal Regulations (CFR) § 257.95. Background groundwater conditions for Appendix III and IV parameters were established between September 2016 and July 2018.

Based on Site groundwater conditions, Georgia Power submitted a notification for the implementation of assessment monitoring under Rule 391-3-4-.10(6)(a) on November 13, 2019. An Assessment of Corrective Measures (ACM) was initiated on July 9, 2020 based on the requirements of GA EPD Rule 391-3-4-.10(6)(a) which incorporates United States Environmental Protection Agency (USEPA) CCR rule (40 CFR Part 257, Subpart D) by reference. Georgia Power submitted an ACM report on December 4, 2020 pursuant to GA EPD Rule 391-3-4-.10(6)(a) (Anchor 2020). The 2020 ACM supersedes previous documents submitted for the Site under the existing GA EPD Permit No. 025-061D(LI) (SCS 2013; ACC 2017, 2019).

During the 2021 semiannual reporting period, ACC completed a groundwater sampling event in September. Groundwater samples were submitted to Pace Analytical Services, LLC (Pace) for analysis. Per the CCR rule, groundwater results for September 2021 were evaluated in

accordance with the certified statistical methods. That evaluation identified statistically significant values of Appendix III[1] constituents above background and statistically significant levels of Appendix IV[2] parameters above groundwater protection standards, as summarized below.

Appendix III Parameter	September 2021
Calcium	GWB-4R, GWB-5R, GWB-6R, GWC-1, GWC-11, GWC-12, GWC-14, GWC-15, GWC-16, GWC-17, GWC-20
Chloride	GWC-17
Fluoride	GWC-17
pH	GWC-12, GWC-15
Sulfate	GWB-4R, GWB-5R, GWB-6R, GWC-11, GWC-12, GWC-14, GWC-16, GWC-17, GWC-20
Appendix IV Parameter[3]	**September 2021**
Arsenic	GWC-15, GWC-16, and GWC-20
Molybdenum	GWB-4R, GWC-1, GWC-15, GWC-16, GWC-20, and GWC-21

Based on review of the statistical results completed for the groundwater monitoring and corrective action program from July through December 2021, the Site will continue assessment monitoring and groundwater remedy selection. Georgia Power will continue routine groundwater monitoring and reporting at the Site and reports will be posted to the website and provided to the GA EPD.

[1] Appendix III: Boron, calcium, chloride, fluoride, pH, sulfate, and total dissolved solids (TDS).
[2] Appendix IV: Antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, fluoride, lead, lithium, mercury, molybdenum, radium 226+228, selenium, and thallium.
[3] An SSL constituent is determined by comparing the confidence intervals developed to either the constituent's maximum contaminant level (MCL), if available, or the calculated background interwell prediction limit.

1.0 Introduction

In accordance with the Georgia Environmental Protection Division (GA EPD) Rules of Solid Waste Management 391-3-4-.10(6)(a)-(c) and 391-3-4-.14, Atlantic Coast Consulting, Inc. (ACC) has prepared this *2021 Semiannual Groundwater Monitoring and Corrective Action Report* to document groundwater monitoring activities conducted during the second half of 2021 at Georgia Power Company's Grumman Road Private Industrial Landfill (GRL). To specify groundwater monitoring requirements, GA EPD Rule 391-3-4-.10(6)(a) incorporates by reference the United States Environmental Protection Agency (USEPA) Coal Combustion Residuals (CCR) Rule 40 Code of Federal Regulations (CFR) § 257 Subpart D.

To comply with GA EPD's Rule 391-3-4-.10, a permit application package for GRL was submitted to GA EPD in November 2018 and is currently under review. To meet the requirements of 391-3-4-.10(6), Appendix III and IV parameters listed in 40 CFR § 257 were incorporated into the routine groundwater monitoring program through a minor modification in August 2017. Semiannual reporting is completed pursuant to GA EPD Rule 391-3-4-.10(6)(c). This report documents groundwater activities conducted July through December 2021.

Georgia Power submitted an Assessment of Corrective Measures (ACM) in December 2020 pursuant to GA EPD Rule 391-3-4-.10(6)(a) (Anchor 2020). The 2020 ACM supersedes previous documents submitted for the Site under the existing GA EPD Permit No. 025-061D(LI) [Southern Company Services (SCS) 2013; ACC 2017, 2019]. The ACM was prepared to evaluate potential groundwater corrective measures for the occurrence of arsenic and molybdenum in groundwater at statistically significant levels (SSLs) at GRL.

1.1 Site Description and Background

GRL is located on Gulfstream Road, in Chatham County, Georgia, approximately 0.8 miles east of Savannah/Hilton Head International Airport and 1.3 miles west of the city of Port Wentworth. GRL occupies approximately 36 acres. The Site ceased accepting CCR prior to October 19, 2015 and is therefore not subject to Federal monitoring requirements. GRL received CCR from Georgia Power – Plant Kraft and operated under GA EPD solid waste handling permit number 025-061D(LI). GRL is comprised of four cells or parcels: Parcel A [originally operated under permit number 025-034D(LI)], B1, B2, and B3. Closure of parcels B1, B2, and B3 was completed after CCR disposal ceased. Capping of the last remaining uncapped portion of Parcel A has recently been completed and was documented to GA EPD in a submittal dated November 27, 2019.

Figure 1, Site Location Map, depicts the location of GRL relative to the surrounding area. Figure 2, Well Location Map, depicts the general configuration of GRL and the location of the monitoring wells.

1.2 Regional Geology and Hydrogeologic Setting

GRL is underlain by Atlantic Coastal Plain Physiographic Province strata consisting of unconsolidated to consolidated layers of sand, silt, and clay and semi-consolidated to dense layers of limestone and dolomite (Clarke et al, 2010). These sediments constitute three major aquifer systems, which are, from shallow to deep, the surficial aquifer system, the Brunswick aquifer system, and the Floridan aquifer system. In the Atlantic Coastal Plain, the surficial aquifer system consists of Miocene and younger interlayered sand, silt, clay, and thin limestone beds (Clarke et al, 2010). The surficial aquifer system is unconfined and generally at a depth less than 80 feet below ground surface.

The surficial aquifer is underlain by a confining unit that separates it from the Brunswick aquifer. The confining unit consists of silty clay and dense thin, phosphatic Miocene limestone. The Oligocene to Miocene Brunswick aquifer consists of two water-bearing zones. The upper Brunswick and lower Brunswick aquifers are separated by a low permeability, sandy phosphatic clay confining unit. The Brunswick aquifer is separated from the Upper Floridan aquifer with the Upper Confining unit and a non-water bearing limestone (NWBL) layer. The Floridan aquifer is confined by the overlying clay and NWBL layers.

1.3 Site Geology and Hydrogeologic Setting

The sediments immediately underlying the Site are part of the regional surficial aquifer system described previously and consist of variable interbedded sands, silts, and clay comprising a near-surface aquifer system (SCS, 1998). Though complex with subtle distinctions, approximately 50 feet of the near-surface aquifer system (soil) can be divided into four units as described below:

- Upper Sands and Topsoil
- Unit 1 Uppermost Aquifer: Silty Fine Sand
- Unit 2 Low Permeability Zone: Interbedded Sand, Silt, and Clay
- Unit 3 Lower Sand Aquifer: Silty and/or Clayey Fine to Medium Sand

Unit 1 comprises the water-bearing soil unit monitored at the site and has a thickness ranging from approximately 22 to 28 feet across GRL. Although Units 1 through 3 are classified as the surficial aquifer system, layers of lower permeability may be present in the surficial aquifer system (Clarke, Hacke, and Peck 1990; SCS 1998). Generally, groundwater in the near-surface aquifer system flows from north to south at the GRL but is influenced by topography. Groundwater elevations observed across the site and adjacent landfills suggest that hydraulic communication exists between Units 1, 2, and 3. Unit 2 has a lower permeability than Units 1 and 3 and locally may act as an impediment to downward migration, creating perched water within Unit 1 or impeding migration within the near-surface aquifer system. Unit 2 does not appear to be continuous across the sites such that it creates distinct groundwater flow systems. The geologic and hydrogeologic conditions at GRL were recently described in detail in the ACM Report (Anchor 2020).

1.4 Groundwater Monitoring System

A groundwater monitoring plan was submitted in November 1999 and approved by GA EPD in January 2000. Pursuant to GA EPD Rule 391-3-4-.10(6)(a) and 40 CFR § 257.91, a comprehensive monitoring system was designed to monitor groundwater passing the waste boundary of GRL within the uppermost aquifer. Wells were located to serve as upgradient and downgradient monitoring points based on groundwater flow direction (Table 1A, Monitoring Network Well Summary). Additional existing locations are presented in Table 1B, Delineation Well and Piezometer Summary.

As part of the assessment monitoring program, vertical delineation wells were installed in December 2020 and January 2021. Pursuant to GA EPD Rule 391-3-4-.10(6)(a) and 40 CFR § 257.95(g)(1)(iv), the wells, classified as “delineation wells”, will be sampled in addition to the compliance monitoring wells as part of the ongoing assessment groundwater monitoring program.

2.0 GROUNDWATER MONITORING ACTIVITIES

The following describes monitoring-related activities performed at the Site from July through December 2021 (the reporting period) and discusses any change in status of the monitoring program.

2.1 Monitoring Well Installation/Maintenance

There were no changes to the groundwater monitoring system during the current semiannual reporting period; the network remained the same as in the previous reporting year and is shown in Figure 2. With the exception of GWC-13, monitoring well-related activities were limited to visual inspection of well conditions prior to sampling, recording the Site conditions, and performing exterior maintenance necessary for sampling under safe and clean conditions.

In October 2021, personnel from Southern Company Services – Civil Field Services (CFS) mobilized to the site to install missing bollards and repair select well pads. The well pad for GWC-13 needed to be raised slightly to be on grade with the surrounding ground surface. The well pad and protective casing were removed, and inert gravel was installed to raise the subgrade. A polyvinyl chloride (PVC) coupler and new length of riser were attached to extend the well to approximately three feet above the raised ground surface, and a new aluminum protective casing and concrete pad were installed. Documentation of all well repairs, and survey data certified by a Georgia Registered Land Surveyor and a revised boring log for GWC-13 are provided in Appendix A, Monitoring Well Repair Documentation.

Monitoring wells are inspected semiannually to determine if any repairs or corrective actions are necessary to meet the requirements of the Georgia Water Well Standards Act (O.C.G.A. § 12-5-134(5)(d)(vii)). In September 2021, monitoring wells were inspected and routine maintenance performed as described in Appendix A. Well inspection checklists completed during semiannual sampling are included in Appendix B, Laboratory Analytical and Field Sampling Reports. This documentation will serve as the required five year well inspection and was performed under the direction of a professional geologist registered in the State of Georgia.

2.2 Assessment Monitoring Program

Georgia Power has initiated an assessment monitoring program for CCR Appendix IV constituents. A notification for the implementation of assessment monitoring under GA EPD Rule 391-3-4-.10(6) was submitted on November 13, 2019. Statistical analyses of the 2019 groundwater data identified SSLs of arsenic in wells GWC-15, GWC-16, and GWC-20 and molybdenum in wells GWB-4R, GWC-1, GWC-15, GWC-16, GWC-20, and GWC-21. The facility had previously implemented an assessment monitoring program for an Appendix II metal (arsenic) included in its state permit.

Table 2, Groundwater Sampling Event Summary, presents a summary of groundwater sampling events completed at the Site during the reporting period. A semiannual assessment monitoring event was completed in September 2021. Groundwater samples were collected for the state-specific list of Appendix I/II metals specified in the permit and all Appendix III and Appendix IV constituents. A summary of the analytes required by Appendix III, Appendix IV, and the existing permit is provided in Table 3, Summary of Groundwater Monitoring Parameters. Samples were collected from each well in the network monitoring system, as well as the five vertical delineation wells, shown on Figure 2.

Details of this event and analytical results are discussed in Section 3, while the statistical results are discussed in Section 4. Results of sampling activities conducted during the reporting period are presented in Appendix B.

2.3 Assessment of Corrective Measures

Based on statistical analysis of assessment monitoring results presented in the 2020 Annual Groundwater Monitoring and Corrective Action Report, a Notice of Assessment of Corrective Measures was placed in the operating record on July 9, 2020 for the State CCR Rule. An ACM for arsenic was previously established under GA EPD Rule 391-3-4-.14. An ACM completed by Anchor QEA, LLC in December 2020 (Anchor, 2020) under GA EPD Rule 391-3-4-.10(6)(a) and 40 CFR § 257.96 supersedes the previous ACM and incorporates arsenic and an additional Appendix IV constituent, molybdenum. A *Semiannual Remedy Selection and Design Progress Report* (Semiannual Progress Report) has been updated to include recent activities and is provided as Appendix C.

2.4 Additional Sampling

As summarized in the Semiannual Progress Report, an active above-ground leachate seep has been observed on aerial imagery on the north side of the Clifton Landfill since approximately 2009. The seepage flows onto the Site near GWA-7. Samples of the leachate seepage were collected on the Site near GWA-7 during the September 2021 sampling event. The laboratory report is included in Appendix B. These data were collected in support of the remedy evaluation and selection process and are discussed in Appendix C.

Due to an anomalous result for cobalt reported in the sample from GWB-5R during the September 2021 event, GWB-5R was resampled for cobalt in November 2021. The resample results are included in Appendix B.

3.0 SAMPLE METHODOLOGY AND ANALYSIS

The following sections describe the methods used to conduct groundwater monitoring at the Site.

3.1 Groundwater Flow Direction, Gradient, and Velocity

Prior to each sampling event, groundwater elevations are recorded from the certified well network and delineation wells at GRL. Groundwater elevations recorded during the monitoring events are summarized in Table 4, Summary of Groundwater Elevations – September 2021. Groundwater elevation data were used to develop Figure 3, September 2021 Potentiometric Surface Map. A potentiometric high exists near well GWA-7 in the northern portion of the Site and groundwater flows semi-radially from this high. In the southern portion of the Site, groundwater flows to the south and southeast. The groundwater flow patterns observed during the monitoring events are consistent with historical patterns.

The groundwater flow velocity at GRL was calculated using a derivation of Darcy's Law.

Specifically:

Equation

$$v = \frac{K\,(dh/dl)}{P_e}$$

where: v = groundwater velocity
K = hydraulic conductivity

dh/dl = hydraulic gradient
P_e = effective porosity

The groundwater flow velocity was calculated for the Site based on hydraulic gradients, average hydraulic conductivity based on previous slug test data, and an estimated effective porosity of 0.20 (based on a review of several sources, including Driscoll, 1986; USEPA, 1989; Freeze and Cherry, 1979). Groundwater flow velocities have been calculated and are tabulated on Table 5, Groundwater Flow Velocity Calculations – September 2021. The calculated maximum flow velocity was 0.32 feet per day for September 2021.

3.2 Groundwater Sampling

Groundwater samples were collected using low-flow sampling procedures in accordance with 40 CFR § 257.93(a). Purging and sampling was performed using a peristaltic pump. Tubing was lowered into the well so that the intake was at the midpoint of the well screen (or as appropriate determined by the water level). Peristaltic pump samples were collected using new disposable polyethylene tubing. All non-disposable equipment was decontaminated before use and between well locations.

Monitoring wells were purged and sampled using low-flow sampling procedures. A SmarTroll or Aqua Troll (In-Situ field instruments) was used to monitor and record field water quality parameters (pH, specific conductance, oxidation-reduction potential [ORP], dissolved oxygen [DO], and temperature) during well purging prior to sampling. Turbidity was measured using a Hach 2100Q portable turbidimeter. Groundwater samples were collected when the following stabilization criteria were met:

- ± 0.1 standard units for pH
- ± 10% for specific conductance
- ± 10% for dissolved oxygen or 0.2 milligrams per liter (mg/L), whichever is greater where DO > 0.5 mg/L. No criterion applies if DO < 0.5 mg/L.
- Turbidity measurements less than 5 nephelometric turbidity units (NTU)

Once stabilization was achieved, samples were collected directly into appropriately preserved laboratory-supplied sample containers. Sample bottles were placed in ice-packed coolers and submitted to Pace Analytical Services, LLC (Pace) of Peachtree Corners, Georgia and Greensburg, Pennsylvania following chain-of-custody protocol. Stabilization logs and equipment calibration forms for each well during the reporting period, are included in Appendix B.

3.3 Laboratory Analyses

Analytical methods used for groundwater monitoring parameters are provided in laboratory reports in Appendix B. Analytical data collected in the monitoring event during the reporting period are summarized in Table 6, Summary of Groundwater Analytical Data – September 2021.

Laboratory analyses were performed by Pace. Pace is accredited by the National Environmental Laboratory Accreditation Program (NELAP) and maintains a NELAP certification for all parameters analyzed for this project. In addition, Pace is certified to perform analysis by the State of Georgia. Laboratory reports and chain-of-custody records for the monitoring event are presented in Appendix B.

3.4 Quality Assurance and Quality Control

During each sampling event, quality assurance/quality control (QA/QC) samples are collected at a rate of one QA/QC sample per every 10 groundwater assessment samples. Equipment blanks (where non-dedicated sampling equipment is used) and duplicate samples were collected during each sampling event. QA/QC sample data were evaluated during data validation and are included in Appendix B.

Groundwater quality data in this report were validated in accordance with USEPA guidance (USEPA, 2011) and the analytical methods. Data validation generally consisted of reviewing sample integrity, holding times, laboratory method blanks, laboratory control samples, matrix spikes/matrix spike duplicate recoveries and relative percent differences (RPDs), post digestion spikes, laboratory and field duplicate RPDs, field and equipment blanks, and reporting limits. Where appropriate, validation qualifiers and flags are applied to the data using USEPA procedures as guidance (USEPA, 2017). The data are considered usable for meeting project objectives and the results are considered valid.

Values followed by a "J" flag indicate that the value is an estimated analyte concentration detected between the method detection limit (MDL) and the laboratory practical quantitation limit (PQL). The estimated value is positively identified but is below the lowest level that can be reliably achieved within specified limits of precision and accuracy under routine laboratory operating conditions. “J” flagged data are used to establish background statistical limits but are not used when performing statistical analyses. Mercury was detected in the associated laboratory method blank, and is discussed further in the Level 2A Data Validations in Appendix B.

4.0 STATISTICAL ANALYSIS

The statistical method used at GRL was developed by Groundwater Stats Consulting, LLC (GSC), using methodology presented in *Statistical Analysis of Groundwater Data at RCRA Facilities, Unified Guidance*, March 2009, USEPA 530/ R-09-007 (USEPA, 2009).

Statistical analysis of the reporting period groundwater monitoring data was performed by GSC following the appropriate certified statistical methodology for GRL. Sanitas groundwater statistical software was used to screen the data and perform the statistical analyses. Sanitas is a decision support software package that incorporates the statistical tests required of Subtitle C and D facilities by USEPA regulations.

Appendix I and Appendix III statistical analysis was performed to determine if groundwater has returned to background levels. Appendix II and Appendix IV constituents were evaluated to determine if concentrations statistically exceeded the established Groundwater Protection Standards (GWPS).

A summary of the statistical methodology used at GRL for routine groundwater monitoring is provided in Table 7, Statistical Method Summary. Statistical analysis methods and results are provided in Appendix D, Statistical Analyses, and summarized in the following sections.

4.1 Appendix I and III Statistical Methods

Based on guidance from GA EPD, statistical tests used to evaluate the groundwater monitoring data consist of interwell prediction limits (PLs) combined with a 1-of-2 verification resample plan for each of the Appendix I and III parameters. Interwell PLs are constructed using pooled data from upgradient wells GWA-7 and GWA-8 to establish a background limit for an individual

constituent. The most recent sample from each downgradient well is compared to the background limit to determine whether there are statistically significant increases (SSIs). An "initial exceedance" occurs when an Appendix I or III constituent reported in downgradient groundwater compliance monitoring well exceeds the constituent's associated PL. The 1-of-2 resample plan allows for collection of an independent resample. A confirmed exceedance is noted only when the resample verifies the initial exceedance. If the resample result is less than its relevant PL, the initial exceedance is not verified.

4.2 Appendix II and IV Statistical Methods

Appendix II constituents and Appendix IV constituents were sampled during the semiannual assessment sampling event. To statistically compare groundwater data to GWPS, confidence intervals are constructed for each of the detected Appendix II and IV parameters in each downgradient well. Those confidence intervals are compared to the GWPS. Only when the entire confidence interval is above a GWPS is the well/constituent pair considered to exceed its GWPS. If there is an exceedance of the established standard, an SSL exceedance is identified.

USEPA revised the federal CCR Rule on July 30, 2018, updating GWPS for cobalt, lead, lithium, and molybdenum. USEPA's updated GWPS have not yet been incorporated under GA EPD's CCR Rule. The GA EPD CCR Rule GWPS is:

(1) The federally established maximum contaminant level (MCL).
(2) Where an MCL has not been established, the background concentration.
(3) Background levels for constituents where the background level is higher than the MCL.

As described in 40 CFR § 257.95(h)(1-3), the GWPS for cobalt, lead, lithium and molybdenum is:

(1) The MCL established under 40 CFR § 141.62 and 141.66.
(2) Where an MCL has not been established:
    (i) Cobalt 0.006 mg/L;
    (ii) Lead 0.015 mg/L;
    (iii) Lithium 0.040 mg/L; and
    (iv) Molybdenum 0.100 mg/L.
(3) Background levels for constituents where the background level is higher than the MCL or rule-specified GWPS.

Following the above state rule requirements, GWPS have been established for statistical comparison of Appendix II and Appendix IV constituents and are presented in Table 8, Summary of Background Levels and Groundwater Protection Standards.

4.3 Statistical Analyses Results

Based on review of the Appendix I and III statistical analyses presented in Appendix D, constituents have not returned to background levels and assessment monitoring should continue pursuant to GA EPD Rule 391-3-4-.10(6)(a). Based on a review of the statistical analysis presented in Appendix D, the following parameters were found to statistically exceed the GWPS for the reporting period:

- Arsenic: GWC-15, GWC-16, and GWC-20
- Molybdenum: GWB-4R, GWC-1, GWC-15, GWC-16, GWC-20, and GWC-21

These results are consistent with those presented in the 2021 Annual Groundwater Monitoring and Corrective Action Report (ACC, 2021). An ACM was submitted in December 2020 for arsenic and molybdenum, per GA EPD Rule 391-3-4-.10(6)(a) and 40 CFR § 257.96, and potential corrective measures are under evaluation.

5.0 NATURE AND EXTENT

Wells MW-23D, MW-24D, and MW-25D were installed for vertical delineation of arsenic and molybdenum, and wells MW-26D and MW-27D were installed for vertical delineation of molybdenum in December 2020 and January 2021. The location of these wells is shown on Figure 2.

Results from the September 2021 groundwater sampling event indicate that vertical delineation is complete: arsenic and molybdenum concentrations in the vertical delineation wells are below the relevant GWPS. The current Appendix IV data set for these wells is limited to less than four independent sampling events which is the minimum number needed to construct confidence intervals to statistically evaluate the results with respect to GWPS. Georgia Power will continue to monitor these wells until an adequately sized data set is available to complete statistical analyses. The September 2021 delineation results are provided in Appendix B.

Data from the August 2021 semiannual monitoring event at Savannah Regional Industrial Landfill (SRIL) show that arsenic concentrations in groundwater samples collected from monitoring wells GWA-6 and GWA-12B located along the northern boundary of SRIL, due south of the Site, are less than the analytical method reporting limit (<0.01 mg/L; CEC 2021). This data is presented in further detail in Appendix C and suggests the arsenic impacts have not migrated far off Site. Molybdenum, however, is not a routine parameter analyzed at SRIL.

Horizontal delineation of molybdenum to the south is dependent on securing access from adjacent property owners. Per GA EPD guidance, where “denial of access prevents the installation of off-site delineation wells, a USEPA approved fate and transport model analysis may be used to delineate the limit of the contaminant plume” (GA EPD, 2018). Because off-site access has not been secured, a transport model was developed to complete horizontal delineation (Anchor QEA, 2021) and is described in Appendix C. Molybdenum concentrations in groundwater above the Site GWPS that originate from the Site have likely migrated a short distance beneath SRIL but have not reached the southern boundary of SRIL. SRIL representatives were notified of the arsenic and molybdenum detections in neighbor notification correspondence dated September 25, 2020.

6.0 MONITORING PROGRAM STATUS

Pursuant to 40 CFR § 257.96(b), Georgia Power will continue to monitor the groundwater at the Site in accordance with the assessment monitoring program regulations of 40 CFR 257.95 while ACM efforts are implemented to evaluate SSL concentrations of arsenic and molybdenum. Pursuant to 40 CFR § 257.94(e)(1), Georgia Power will continue assessment monitoring in accordance with 40 CFR § 257.95. Pursuant to 40 CFR § 257.95(g)(1)(iv), the delineation wells will continue to be sampled as part of the ongoing semiannual assessment groundwater monitoring program.

6.1 Assessment of Corrective Measures

An ACM was implemented on July 9, 2020 and submitted to EPD on December 4, 2020. The ACM efforts completed during the reporting period covered by this groundwater monitoring and

corrective action report are presented in Appendix C. The Semiannual Progress Report summarizes:

(i) the current conceptual site model applicable to evaluating groundwater corrective measures proposed in the ACM Report (Anchor, 2020).
(ii) the analytical data obtained during supplemental ACM-specific field investigations.
(iii) the status of applicable corrective measures evaluation; and
(iv) the planned activities and anticipated schedule for the following semiannual reporting period.

Georgia Power will include Semiannual Progress Reports with each future groundwater monitoring and corrective action report.

7.0 CONCLUSIONS AND FUTURE ACTIONS

This 2021 Semiannual Groundwater Monitoring and Corrective Action Report was prepared to fulfill the requirements of GA EPD Rule 391-3-4-.10(6)(c). Statistical evaluations of the groundwater monitoring data identified the presence of SSLs of arsenic (GWC-15, GWC-16, and GWC-20) and molybdenum (GWB-4R, GWC-1, GWC-15, GWC-16, GWC-20, and GWC-21) above the GWPS. The arsenic and molybdenum SSLs are vertically delineated below the GWPS by MW-23D through MW-27D. Arsenic is horizontally delineated below the GWPS by upgradient SRIL wells GWA-6 and GWC-12B, just south of the Site. Based on the Transport Model submitted November 2021 to EPD, molybdenum is horizontally delineated to below the GWPS a short distance beneath SRIL but have not reached the southern boundary of SRIL. Georgia Power will continue to monitor groundwater under the assessment monitoring program and evaluate potential corrective measures presented in the Semiannual Progress Report provided in Appendix C.

The next semiannual assessment sampling event is planned to begin January 2022. The semiannual assessment monitoring event will include sampling and analysis of all Appendix III and IV constituents along with the state-specific list of Appendix I/II metals specified in the permit.

MW-26D	49.39	18.97	30.42
MW-27D	50.53	20.83	29.70

Notes:
1. ft BTOC indicates feet below top of casing.
2. SD indicates feet relative to Site Datum.
3. Depths to water measured on September 20, 2021.

Table 5
Groundwater Flow Velocity Calculations
September 2021
Grumman Road Landfill
Chatham County, Georgia

Equation

$$v = \frac{K\,(dh/dl)}{P_e}$$

where: v = groundwater velocity
K = hydraulic conductivity
dh/dl = hydraulic gradient
P_e = effective porosity

Values Used in Calculation

Value			Source
K =	2.7E-03	cm/sec	See note 1.
	7.60	ft/day	
dh/dl_{max} =	13.29/1576	ft/ft	hydraulic gradient from GWB-6R to GWC-16
=	0.008		
dh/dl_{min} =	2.04/737	ft/ft	hydraulic gradient from GWA-7 to GWC-17
=	0.003		
P_e =	0.20		See note 2.

$$v_{max} = \frac{(7.60)\,(0.008)}{0.20} \qquad v_{max} = 0.32 \text{ ft/day}$$

$$v_{min} = \frac{(7.60)\,(0.003)}{0.20} \qquad v_{min} = 0.11 \text{ ft/day}$$

Notes

(1) Grumman Road Monofill Groundwater Monitoring Plan (SCS, 1999)

(2) Default value for silty sands from Interim Final RCRA Investigation (EPA, 1989)

	Zinc	<0.035	<0.0070	<0.0070	<0.0070	--	<0.0070	<0.0070	<0.0070

Notes:
1. Results for substances are reported in milligrams per liter (mg/L). Results for pH are reported in standard units (S.U.). Radium results are reported in picocuries per liter (pCi/L).
2. Radium data are for Radium 226 & Radium 228 (combined).
3. < indicates the substance was not detected above the relevant laboratory method detection limit (MDL).
4. J indicates the substance was detected at such low levels that the precision of the laboratory instruments could not produce a reliable value. Therefore, the value displayed (value J) is qualified by the laboratory as an estimated number.
5. TDS indicates total dissolved solids.
6. U indicates the substance was detected below the Minimum Detection Concentration (MDC) and the precision of the laboratory instruments could not produce a reliable value. Therefore, the value followed by U is qualified by the laboratory as estimated.
7. Appendix III = indicator parameters evaluated during Detection and Assessment Monitoring; Appendix IV = parameters included and evaluated during Assessment Monitoring.
8. Parameters required by Permit are Appendix I/II parameters included to meet EPD Rule 391-3-4-.14 requirements.
9. Mercury was detected in the associated laboratory method blank, and results are qualified as non-detect in the Level 2A Laboratory Data Validations in Appendix B.
10. -- indicates parameter not analyzed during verification sampling.

See Note 8	Vanadium	<0.0019	0.0020 J	0.0051 J	<0.0019	0.0052 J	0.0022 J	0.0025 J	<0.0019
	Zinc	<0.0070	<0.0070	<0.0070	0.036	0.010	<0.0070	<0.0070	<0.0070

Notes:
1. Results for substances are reported in milligrams per liter (mg/L). Results for pH are reported in standard units (S.U.). Radium results are reported in picocuries per liter (pCi/L).
2. Radium data are for Radium 226 & Radium 228 (combined).
3. < indicates the substance was not detected above the relevant laboratory method detection limit (MDL).
4. J indicates the substance was detected at such low levels that the precision of the laboratory instruments could not produce a reliable value. Therefore, the value displayed (value J) is qualified by the laboratory as an estimated number.
5. TDS indicates total dissolved solids.
6. U indicates the substance was detected below the Minimum Detection Concentration (MDC) and the precision of the laboratory instruments could not produce a reliable value. Therefore, the value followed by U is qualified by the laboratory as estimated.
7. Appendix III = indicator parameters evaluated during Detection and Assessment Monitoring; Appendix IV = parameters included and evaluated during Assessment Monitoring.
8. Parameters required by Permit are Appendix I/II parameters included to meet EPD Rule 391-3-4-.14 requirements.
9. Mercury was detected in the associated laboratory method blank, and results are qualified as non-detect in the Level 2A Laboratory Data Validations in Appendix B.
10. -- indicates parameter not analyzed during verification sampling.

Statistical Method Summary
Grumman Road Landfill
Chatham County, Georgia

Statistical Method Summary		
Monitoring Well Network	Upgradient Wells	GWA-7 and GWA-8
	Sidegradient Wells	GWB-4R, GWB-5R, and GWB-6R
	Downgradient Wells	GWC-1, GWC-2, GWC-9, GWC-11, GWC-12, GWC-13, GWC-14, GWC-15, GWC-16, GWC-17, GWC-20, GWC-21, and GWC-22
CCR Monitoring Parameters	Appendix III (Detection Monitoring)	Boron, Calcium, Chloride, Fluoride, pH, Sulfate, and TDS
	Appendix IV (Assessment Monitoring)	Antimony, Arsenic, Barium, Beryllium, Cadmium, Chromium, Cobalt, combined Radium 226 + 228, Fluoride, Lead, Lithium, Mercury, Molybdenum, Selenium, and Thallium
EPD Permit Metals	Appendix I (Detection Monitoring)	Antimony, Arsenic, Barium, Chromium, Lead, Selenium, Vanadium, and Zinc
	Appendix II (Assessment Monitoring)	Antimony, Arsenic, Barium, Chromium, Lead, Selenium, Vanadium, and Zinc
Statistical Methodology	Data Screening Proposed Background	Evaluate outliers, trends, and seasonality when sufficient data are available
	Statistical Limits	Interwell statistical limits.

Table 8
Summary of Background Levels and Groundwater Protection Standards
Grumman Road Landfill
Chatham County, Georgia

Constituent	Site Background	MCL	GWPS
Antimony	0.003	0.006	0.006
Arsenic	0.029	0.01	0.029
Barium	0.22	2	2
Beryllium	0.003	0.004	0.004
Cadmium	0.0007	0.005	0.005
Chromium	0.068	0.1	0.1
Cobalt	0.01	N/A	0.01
Fluoride	0.45	4	4
Lead	0.013	N/A	0.013
Lithium	0.03	N/A	0.03
Mercury	0.0002	0.002	0.002
Molybdenum	0.01	N/A	0.01
Radium	32.08	5	32.08
Selenium	0.044	0.05	0.05
Thallium	0.001	0.002	0.002
Vanadium	0.43	N/A	0.43
Zinc	0.16	N/A	0.16

Notes:
1. Site Background = Tolerance limits calculated from pooled upgradient well data through present.
2. MCL = Maximum Contaminant Level, per Georgia EPD Rule 391-3-5-.18(1)(a).
3. GWPS = Groundwater protection standard, per Georgia EPD Rule 391-3-4-.10(6)(a).
4. Units are milligrams per liter (mg/L), except for radium, which are picocuries per liter (pCi/L).
5. The background tolerance limit (TL) used to evaluate GWPS for lithium is equal to the most recent laboratory-specified reporting limit (RL). Per the SAP, and in accordance with the Unified Guidance, a non-parametric limit approach was used because the data set contains greater than 50% non-detect results for this analyte. Under this approach, the TL equals the highest value reported, for which is the laboratory RL. However, the highest laboratory RL in background was 0.05 mg/L. As a result, the GWPS has been modified to be equal to the most recently used RL, which is 0.03 mg/L.
6. Site Background was the same for September 2021 and March 2021, except for fluoride (lowered from 0.49 to 0.45 mg/L) and radium (lowered from 33.8 to 32.08 pCi/L). GWPS were the same for both events, except for radium which was lowered from 33.8 pCi/L to 32.08 pCi/L.
7. N/A = There is no established MCL, per Georgia EPD Rule 391-3-5-.18(1)(a).

MEMORANDUM

Date: October 18, 2021

To: Kristen Jurinko – Southern Company

CC: Lauren Coker – Southern Company, Ben Hodges – Georgia Power

From: Atlantic Coast Consulting

Subject: Grumman Road Private Industrial Landfill - Well Maintenance and Repair Documentation
Georgia Power Company

Atlantic Coast Consulting (ACC) has prepared this memorandum to provide documentation of groundwater monitoring well maintenance and/or repair performed at Grumman Road during the 2021 Semiannual Groundwater Monitoring reporting period. Additional documentation of maintenance/repairs completed by Southern Company Services – Civil Field Services in October 2021 is also included in this memorandum. All repairs and maintenance were completed in accordance with the Georgia Environmental Protection Division (GAEPD) guidance on routine visual inspections of groundwater monitoring wells.

Georgia Power Site/Unit	Date Performed	Well ID	Maintenance/ Repair Performed
Grumman Road	10/2021	GWA-7	Added 4 bollards
Grumman Road	10/2021	GWA-8	Repaired corner of pad and added 4 bollards
Grumman Road	10/2021	GWC-1	Added 2 bollards
Grumman Road	10/2021	GWC-2	Repaired corner of pad and added 4 bollards
Grumman Road	10/2021	GWB-4R	Added 4 bollards
Grumman Road	10/2021	GWC-9	Repaired corner of pad and added 4 bollards
Grumman Road	10/2021	GWC-10	Added 4 bollards
Grumman Road	10/2021	GWC-11	Added 4 bollards

Georgia Power Site/Unit	Date Performed	Well ID	Maintenance/ Repair Performed
Grumman Road	10/2021	GWC-12	Well pad cleaned off and added 4 bollards
Grumman Road	10/2021	GWC-13	Raised and replaced well pad, raised well riser, installed new aluminum protective cover, added pea gravel to anulus of protective cover, drilled vent and weep holes, and re-surveyed well
Grumman Road	10/2021	GWC-14	Added 2 bollards
Grumman Road	10/2021	GWC-16	Added 2 bollards
Grumman Road	10/2021	GWC-20	Added 4 bollards
Grumman Road	10/2021	GWC-21	Added 4 bollards
Grumman Road	10/2021	GWC-22	Added 2 bollards
Grumman Road	9/2021	MW-23D	Added well label.
Grumman Road	9/2021	MW-24D	Added well label.
Grumman Road	9/2021	MW-25D	Added well label.
Grumman Road	9/2021	MW-26D	Added well label.

SUBJECT: Grumman Road Landfill: GWC-13

The following data has been established on the new well using existing site datum. The well was surveyed to the following tolerances: 0.01' vertical and 0.5' horizontal via conventional survey methods and level loops. Survey measurements were cross-checked for horizontal and vertical accuracy. Date of Survey: 11/10/2021.

RE: Project: GRUMMAN ROAD LANDFILL
Pace Project No.: 92563313

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on September 24, 2021. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Charlotte
- Pace Analytical Services - Peachtree Corners, GA

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Nicole D'Oleo

QUALIFIERS

Project: GRUMMAN ROAD LANDFILL
Pace Project No.: 92563313

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

B	Analyte was detected in the associated method blank.
D3	Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

RE: Project: GRUMMAN ROAD LANDFILL RADS
Pace Project No.: 92563306

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on September 24, 2021. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Nicole D'Oleo

QUALIFIERS

Project: GRUMMAN ROAD LANDFILL RADS
Pace Project No.: 92563306

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Act - Activity

Unc - Uncertainty: SDWA = 1.96 sigma count uncertainty, all other matrices = Expanded Uncertainty (95% confidence interval). Gamma Spec = Expanded Uncertainty (95.4% Confidence Interval)

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

Quality Control Review of Analytical Data – September 2021

This narrative presents results of the Quality Control (QC) data review performed on analytical data submitted by Pace Analytical Services, Asheville, Atlanta, Charlotte, and Pittsburgh for groundwater samples collected at Grumman Road between September 21, 2021 and September 23, 2021. The chemical data were reviewed to identify quality issues which could affect the use of the data for decision-making purposes.

Information regarding the primary sample locations, analytical parameters, QC samples, sampling dates, and laboratory sample delivery group (SDG) designations is summarized in Table 1 of this Appendix.

In accordance with groundwater monitoring and corrective action procedures discussed in Title 40 CFR, Subpart D – Standards for the Disposal of Coal Combustion Residuals in Landfills and Surface Impoundments, the samples were analyzed for detected monitoring constituents listed in 40 CFR, Part 257, Appendix III and assessment monitoring constituents listed in 40 CFR, Part 257, Appendix IV. Test methods included Inductively Coupled Plasma (USEPA 6010D), Inductively Coupled Plasma – Mass Spectrometry (USEPA Method 6020B), Mercury in Liquid Wastes (USEPA Method 7470A), Determination of Inorganic Anions (USEPA Method 300.0), Solids in Water (Standard Methods 2540C), Radium-226 (USEPA 9315), and Radium-228 (USEPA Method 9320).

Data were reviewed in accordance with the USEPA Region IV Data Validation Standard Operating Procedures for Contract Laboratory Program Inorganic Data by Inductively Coupled Plasma – Atomic Emission Spectroscopy and Inductively Coupled Plasma – Mass Spectroscopy (September 2011, Rev. 2.0)[1] and the National Functional Guidelines for Inorganic Superfund Methods Data Review (January 2017)[2]. The review included an assessment of the results for completeness, precision (laboratory duplicate recoveries and matrix spike/matrix spike duplicate recoveries), accuracy (laboratory control samples and matrix spike samples), and blank contamination (field, equipment, and laboratory blanks). Sample receipt conditions, holding times, and chains of custody (COCs) were reviewed. Where there was a discrepancy between the QC criteria in the guidelines and the QC criterion established in the analytical methodology, method-specific criteria or professional judgment were used.

DATA QUALITY OBJECTIVES

Laboratory Precision: Laboratory goals for precision were met, with the exception of radium-226 on DUP-3 (92563306032) as described in the qualification section below.

Field Precision: Field goals for precision were met, with the exceptions of boron on GWC-21 (92563313019), radium-226 and radium-228 on GWB-4R (92563306002), and radium-228 on (92563306013) as described in the qualifications section below.

Accuracy: Laboratory goals for accuracy were met, with the exceptions of calcium from GWB-5R (92563313003), boron from GWB-4R (92563313002), fluoride from GWC-11 (92563313008), and fluoride from GWC-20 (92563313018) as described in the qualifications section below.

Detection Limits: Project goals for detection limits were met. Certain samples were diluted due to the concentration of target or non-target analyte interferences. Dilutions do not require qualifications based on USEPA guidelines. Reporting limits (RLs) of non-detect compounds are elevated proportional to the dilution when undiluted sample results were not provided by the laboratory. The data usability of diluted results was evaluated by the data user in the context of site-wide characterization.

Completeness: There were no rejected analytical results for this event, resulting in a completion of 100%.

Holding Times: Holding time requirements were met.

QUALIFICATIONS

In general, chemical results for the samples collected at the site were qualified on the basis of low precision or low accuracy or on the basis of professional judgment. The following definitions provide brief explanations of the qualifiers which may have been assigned to data by the laboratory during the validation process:

J: The analyte was positively identified above the method detection limit; however, the associated numerical value is the approximate concentration of the analyte in the sample

ND: The analyte was not detected above the method detection limit

The data generated as part of this sampling event met the QC criteria established in the respective analytical methods and data validation guidelines except as specified below. The applied qualifications may not have been required for all samples collected at the site. A summary of sample qualifications can be found in Table 2 of this Appendix.

- Samples GWC-21 (92563313019) and DUP-2 (92563313029) were qualified as estimated (J) for boron as the field relative percent difference (RPD) exceeded QC criteria (24.85% above limit of 20).

- Samples GWB-4R (92563306002) and DUP-1 (92563306026) were qualified as estimated (J) for radium-226 and radium-228 as the field RPDs exceeded QC criteria (23.48% and 60.54%, respectively, above limit of 20).

- Samples GWC-2 (92563306013) and DUP-3 (92563306032) were qualified as estimated (J) for radium-228 as the field RPD exceeded QC criteria (52.99% above limit of 20).

- Sample DUP-3 (92563306032) was qualified as estimated (J) for radium-226 as the lab RPD exceeded QC criteria (140.74% above limit of 25).

- Sample GWB-5R (92563313003) was qualified as estimated (J) for calcium as the associated matrix spike (MS) and matrix spike duplicate (MSD) recoveries were outside QC criteria (856% and 604% above the range of 75-125).

- Sample GWB-4R (92563313002) was qualified as estimated (J) for boron as the MS and MSD recoveries were outside QC criteria (51% and 55% below the range of 75-125).

- Sample GWC-11 (92563313008) was qualified as estimated (J) for fluoride as the MS and MSD recoveries were outside QC criteria (156% and 146% above the range of 90-110).

- Sample GWC-20 (92563313018) was qualified as estimated (J) for fluoride as the MSD recovery was outside QC criteria (114% above the range of 90-110).

- Certain Mercury results were qualified as non-detect (ND) due to the analyte(s) being detected at a similar concentration in an associated blank sample. As shown in Table 2, when the original sample result was below the RL, the method detection limit (MDL) was raised to the sample result as part of the qualification process.

Atlantic Coast Consulting, Inc. reviewed the laboratory data from Grumman Road sampled between September 21, 2021 and September 23, 2021 in accordance with the analytical methods, the laboratory-specified QC criteria, and the guidelines. As described above, the results were acceptable for project use.

TABLE 2

Georgia Power Company – Grumman Road

Qualifier Summary Table – September 2021

SDG	Field Identification	Constituent	New RL	New MDL or MDC	Qualifier	Reason
563313	GWB-4R	Boron			J	MS/MSD outside QC criteria
563313	GWB-5R	Calcium			J	MS/MSD outside QC criteria
563313	GWC-11	Fluoride			J	MS/MSD outside QC criteria
563313	GWC-20	Fluoride			J	MSD outside QC criteria
563313	GWA-7	Mercury		0.00010	ND	Blank detection
563313	GWB-4R	Mercury		0.00010	ND	Blank detection
563313	GWB-5R	Mercury		0.00010	ND	Blank detection
563313	GWB-6R	Mercury		0.00010	ND	Blank detection
563313	MW-26D	Mercury		0.00010	ND	Blank detection
563313	MW-27D	Mercury		0.00011	ND	Blank detection
563313	GWA-8	Mercury		0.00011	ND	Blank detection
563313	GWC-11	Mercury		0.00010	ND	Blank detection
563313	GWC-12	Mercury		0.00010	ND	Blank detection
563313	GWC-13	Mercury		0.00010	ND	Blank detection
563313	GWC-22	Mercury		0.00010	ND	Blank detection
563313	GWC-2	Mercury		0.00010	ND	Blank detection
563313	GWC-9	Mercury		0.00011	ND	Blank detection
563313	GWC-14	Mercury		0.00011	ND	Blank detection
563313	GWC-16	Mercury		0.00010	ND	Blank detection
563313	GWC-17	Mercury		0.00011	ND	Blank detection
563313	GWC-20	Mercury		0.00011	ND	Blank detection
563313	GWC-21	Mercury		0.00011	ND	Blank detection
563313	MW-23D	Mercury		0.00011	ND	Blank detection
563313	MW-24D	Mercury		0.00010	ND	Blank detection
563313	MW-25D	Mercury		0.00010	ND	Blank detection
563313	GWC-1	Mercury		0.00010	ND	Blank detection
563313	GWC-15	Mercury		0.00010	ND	Blank detection
563313	GWC-21	Boron			J	RPD exceeds field goal
563313	DUP-2	Boron			J	RPD exceeds field goal
563306	GWB-4R	Radium-226			J	RPD exceeds field goal
563306	DUP-1	Radium-226			J	RPD exceeds field goal
563306	GWB-4R	Radium-228			J	RPD exceeds field goal
563306	DUP-1	Radium-228			J	RPD exceeds field goal

Abbreviations:
MDC – Minimum Detectable Concentration
MS/MSD – Matrix Spike / Matrix Spike Duplicate
MDL – Method Detection Limit
RL – Reporting Limit
RPD – Relative Percent Difference
SDG – Sample Delivery Group
TDS – Total Dissolved Solids

Qualifiers:
J – Estimated Result
ND – Non-Detect Result

TABLE 2 (continued)

Georgia Power Company – Grumman Road

Qualifier Summary Table – September 2021

SDG	Field Identification	Constituent	New RL	New MDL or MDC	Qualifier	Reason
563306	GWC-2	Radium-228			J	RPD exceeds field goal
563306	DUP-3	Radium-228			J	RPD exceeds field goal
563306	DUP-3	Radium-226			J	RPD exceeds lab goal

Abbreviations:
MDC – Minimum Detectable Concentration
MS/MSD – Matrix Spike / Matrix Spike Duplicate
MDL – Method Detection Limit
RL – Reporting Limit
RPD – Relative Percent Difference
SDG – Sample Delivery Group
TDS – Total Dissolved Solids

RE: Project: GRUMMAN CLIFTON SEEP-Revised Report
Pace Project No.: 92563324

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on September 24, 2021. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Gulf Coast
- Pace Analytical Services - Asheville
- Pace Analytical Services - Charlotte
- Pace Analytical Services - Peachtree Corners, GA

This revision was issued on 10/17/21 to include appropriate qualifiation on the Nitrate result.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Nicole D'Oleo

QUALIFIERS

Project: GRUMMAN CLIFTON SEEP-Revised Report
Pace Project No.: 92563324

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

B	Analyte was detected in the associated method blank.
D3	Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

RE: Project: GRUMMAN CLIFTON SEEP RADS
Pace Project No.: 92563301

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on September 24, 2021. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Nicole D'Oleo

QUALIFIERS

Project: GRUMMAN CLIFTON SEEP RADS
Pace Project No.: 92563301

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Act - Activity

Unc - Uncertainty: SDWA = 1.96 sigma count uncertainty, all other matrices = Expanded Uncertainty (95% confidence interval). Gamma Spec = Expanded Uncertainty (95.4% Confidence Interval)

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

Quality Control Review of Analytical Data – September 2021

This narrative presents results of the Quality Control (QC) data review performed on analytical data submitted by Pace Analytical Services, Asheville, Atlanta, Charlotte, Gulf Coast, and Pittsburgh for the water sample collected at Grumman Road Clifton Seep on September 23, 2021. The chemical data were reviewed to identify quality issues which could affect the use of the data for decision-making purposes.

Information regarding the primary sample location, analytical parameters, QC samples, sampling date, and laboratory sample delivery group (SDG) designations is summarized in Table 1 of this Appendix. SDG 92563324 was revised to add a missing qualification for nitrate analysis.

In accordance with water monitoring and corrective action procedures discussed in Title 40 CFR, Subpart D – Standards for the Disposal of Coal Combustion Residuals in Landfills and Surface Impoundments, the sample was analyzed for detected monitoring constituents listed in 40 CFR, Part 257, Appendix III and assessment monitoring constituents listed in 40 CFR, Part 257, Appendix IV. Test methods included Inductively Coupled Plasma (USEPA 6010D), Inductively Coupled Plasma – Mass Spectrometry (USEPA Method 6020B), Mercury in Liquid Wastes (USEPA Method 7470A), Determination of Inorganic Anions (USEPA Method 300.0), Solids in Water (Standard Methods 2540C), Radium-226 (USEPA 9315), and Radium-228 (USEPA Method 9320) as well as select geochemical indicator parameters.

Data were reviewed in accordance with the USEPA Region IV Data Validation Standard Operating Procedures for Contract Laboratory Program Inorganic Data by Inductively Coupled Plasma – Atomic Emission Spectroscopy and Inductively Coupled Plasma – Mass Spectroscopy (September 2011, Rev. 2.0)[1] and the National Functional Guidelines for Inorganic Superfund Methods Data Review (January 2017)[2]. The review included an assessment of the results for completeness, precision (laboratory duplicate recoveries and matrix spike/matrix spike duplicate recoveries), accuracy (laboratory control samples and matrix spike samples), and blank contamination (laboratory blanks). Sample receipt conditions, holding times, and chains of custody (COCs) were reviewed. Where there was a discrepancy between the QC criteria in the guidelines and the QC criterion established in the analytical methodology, method-specific criteria or professional judgment were used.

DATA QUALITY OBJECTIVES

Laboratory Precision: Laboratory goals for precision were met.

Field Precision: Field goals for precision were not applicable to this sampling event.

Accuracy: Laboratory goals for accuracy were met, with the exceptions of nitrate and combined NO3-NO2 as described in the qualifications section below.

Detection Limits: Project goals for detection limits were met. Certain analyses were diluted due to the concentration of target or non-target analyte interferences. Dilutions do not require qualifications based on USEPA guidelines. Reporting limits (RLs) of non-detect compounds are elevated proportional to the dilution when undiluted sample results were not provided by the laboratory. The data usability of diluted results was evaluated by the data user in the context of site-wide characterization.

Completeness: There were no rejected analytical results for this event, resulting in a completion of 100%.

Holding Times: Holding time requirements were met.

QUALIFICATIONS

In general, chemical results for the sample collected at the site were qualified on the basis of low precision or low accuracy or on the basis of professional judgment. The following definitions provide brief explanations of the qualifiers which may have been assigned to data by the laboratory during the validation process:

J: The analyte was positively identified above the method detection limit; however, the associated numerical value is the approximate concentration of the analyte in the sample

ND: The analyte was not detected above the method detection limit

The data generated as part of this sampling event met the QC criteria established in the respective analytical methods and data validation guidelines except as specified below. The applied qualifications may not have been required for all samples collected at the site. A summary of sample qualifications can be found in Table 2 of this Appendix.

- Sample CLIFTON SEEP (92563324001) was qualified as estimated (J) for nitrate and NO3 plus NO2 as the associated matrix spike (MS) and matrix spike duplicate (MSD) recoveries were outside QC criteria (nitrate 556% and 566% and NO3-NO2 529% and 545% above the range of 90-110).

- The mercury result was qualified as non-detect (ND) due to the analyte(s) being detected at a similar concentration in an associated blank sample. As shown in Table 2, when the original sample result was below the RL, the method detection limit (MDL) was raised to the sample result as part of the qualification process.

Atlantic Coast Consulting, Inc. reviewed the laboratory data from Grumman Road Clifton Seep sampled on September 23, 2021 in accordance with the analytical methods, the laboratory-specified QC criteria, and the guidelines. As described above, the results were acceptable for project use.

Georgia Power Company – Clifton Seep

Qualifier Summary Table – September 2021

SDG	Field Identification	Constituent	New RL	New MDL or MDC	Qualifier	Reason
563324	CLIFTON SEEP	Mercury		0.00012	ND	Blank detection
563324	CLIFTON SEEP	Nitrate			J	MS/MSD outside QC criteria
563324	CLIFTON SEEP	NO3-NO2			J	MS/MSD outside QC criteria

Abbreviations:
MDC – Minimum Detectable Concentration
MS/MSD – Matrix Spike / Matrix Spike Duplicate
MDL – Method Detection Limit
RL – Reporting Limit
RPD – Relative Percent Difference
SDG – Sample Delivery Group
TDS – Total Dissolved Solids

Qualifiers:
J – Estimated Result
ND – Non-Detect Result

RE: Project: GRUMMAN ROAD LANDFILL
Pace Project No.: 92571998

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on November 11, 2021. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Charlotte
- Pace Analytical Services - Peachtree Corners, GA

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Nicole D'Oleo

Nicole D'Oleo

QUALIFIERS

Project: GRUMMAN ROAD LANDFILL
Pace Project No.: 92571998

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

LEVEL 2A LABORATORY DATA VALIDATIONS

Grumman Road

Resample Event

November 2021

Georgia Power Company – Grumman Road

Quality Control Review of Analytical Data – November 2021

This narrative presents results of the Quality Control (QC) data review performed on analytical data submitted by Pace Analytical Services, Atlanta for the groundwater sample collected at Grumman Road November 10, 2021. The chemical data were reviewed to identify quality issues which could affect the use of the data for decision-making purposes.

Information regarding the primary sample locations, analytical parameter, QC samples, sampling date, and laboratory sample delivery group (SDG) designation is summarized in Table 1 of this Appendix.

In accordance with groundwater monitoring and corrective action procedures discussed in Title 40 CFR, Subpart D – Standards for the Disposal of Coal Combustion Residuals in Landfills and Surface Impoundments, the resample was analyzed for an assessment monitoring constituent listed in 40 CFR, Part 257, Appendix IV. The test method included Inductively Coupled Plasma – Mass Spectrometry (USEPA Method 6020B).

Data were reviewed in accordance with the USEPA Region IV Data Validation Standard Operating Procedures for Contract Laboratory Program Inorganic Data by Inductively Coupled Plasma – Atomic Emission Spectroscopy and Inductively Coupled Plasma – Mass Spectroscopy (September 2011, Rev. 2.0)[1] and the National Functional Guidelines for Inorganic Superfund Methods Data Review (January 2017)[2]. The review included an assessment of the results for completeness, precision (laboratory duplicate recoveries and matrix spike/matrix spike duplicate recoveries), accuracy (laboratory control samples and matrix spike samples), and blank contamination (field, equipment, and laboratory blanks). Sample receipt conditions, holding times, and chains of custody (COCs) were reviewed. Where there was a discrepancy between the QC criteria in the guidelines and the QC criterion established in the analytical methodology, method-specific criteria or professional judgment were used.

DATA QUALITY OBJECTIVES

Laboratory Precision: Laboratory goals for precision were met.

Field Precision: Field goals for precision were not applicable to this sampling event.

Accuracy: Laboratory goals for accuracy were met.

Detection Limits: Project goals for detection limits were met.

Completeness: There were no rejected analytical results for this event, resulting in a completion of 100%.

Holding Times: Holding time requirements were met.

QUALIFICATIONS

In general, chemical results for the samples collected at the site were qualified on the basis of low precision or low accuracy or on the basis of professional judgment. The following definitions provide brief explanations of the qualifiers which may have been assigned to data by the laboratory during the validation process:

J: The analyte was positively identified above the method detection limit; however, the associated numerical value is the approximate concentration of the analyte in the sample

ND: The analyte was not detected above the method detection limit

The data generated as part of this resampling event met the QC criteria established in the analytical method and data validation guidelines. No sample qualifications were required.

Atlantic Coast Consulting, Inc. reviewed the laboratory data from Grumman Road resampled November 10, 2021 in accordance with the analytical method, the laboratory-specified QC criteria, and the guidelines. As described above, the results were acceptable for project use.

Engineer's Certification

This *Semiannual Remedy Selection and Design Progress Report* has been prepared for Georgia Power Company's Grumman Road Private Industrial Landfill in accordance with the U.S. Environmental Protection Agency coal combustion residuals rule, specifically 40 Code of Federal Regulations 257.97(a) and the Georgia Environmental Protection Division Rules for Solid Waste Management 391-3-4-.10(6)(a). This report describes the progress made during the second semiannual period of 2021 in selecting and designing a remedy previously documented in the *Assessment of Corrective Measures* (Anchor QEA 2020).

This report was prepared under the supervision and direction of the undersigned, whose seal as a registered professional engineer is affixed below. The undersigned is practicing through Anchor QEA, LLC, which is an authorized engineering business in the State of Georgia (Certificate of Authorization license number PEF006751; a copy of this license is provided in Appendix A).

1 Introduction

In accordance with the Georgia Environmental Protection Division (GA EPD) Rules for Solid Waste Management 391-3-4.10(6)(a), this *Semiannual Remedy Selection and Design Progress Report* has been prepared for the Grumman Road Private Industrial Landfill (Site). Assessment of corrective measures (ACM) requirements of GA EPD Rule 391-3-4.10(6)(a) are incorporated by reference from the U.S. Environmental Protection Agency (USEPA) coal combustion residuals (CCR) rule (40 Code of Federal Regulations [CFR] Part 257, Subpart D).

This progress report supports the *Assessment of Corrective Measures* (ACM Report; Anchor QEA 2020), which Georgia Power Company (Georgia Power) submitted on December 4, 2020. Georgia Power has placed the ACM Report in the Site's operating record and posted it to the Site's CCR rule compliance website. The purpose of the ACM Report (and subsequent semiannual progress reports) is to evaluate potential corrective measures to address the occurrence of arsenic and molybdenum in groundwater at statistically significant levels (SSLs). This process is typically iterative and may be composed of multiple steps to analyze the effectiveness of corrective measures to improve groundwater quality.

Pursuant to 40 CFR 257.97, Georgia Power is evaluating the potential corrective measures presented in the ACM Report to identify an appropriate remedy or combination of remedies as soon as feasible (Anchor QEA 2020). In the ACM Report, the following remedies were considered feasible for corrective measures for groundwater at the Site:

- Geochemical approaches (in situ injection)
- Hydraulic containment (pump-and-treat)
- In situ stabilization/solidification (ISS)
- Monitored natural attenuation (MNA)
- Permeable reactive barrier (PRB) wall
- Phytoremediation
- Subsurface vertical barrier wall

A comparative screening of these corrective measures is presented in Table 1 and summarized in Section 5.

This *Semiannual Remedy Selection and Design Progress Report* is included as an appendix to the *2021 Semiannual Groundwater Monitoring and Corrective Action Report* (ACC 2022). Georgia Power will include future semiannual remedy selection progress reports as an appendix to the routine semiannual groundwater monitoring and corrective action reports.

Georgia Power has proactively initiated adaptive site management as outlined in the ACM Report (Anchor QEA 2020) to support the groundwater remedy selection process and address potential

changes in Site conditions as appropriate. The adaptive site management approach takes existing Site conditions, including natural attenuation mechanisms, into account.

1.1 Site Background

The Site, located in Port Wentworth, Georgia, is a permitted industrial landfill owned and operated by Georgia Power previously used for disposal of coal ash from Georgia Power's Plant Kraft. The Site has not received ash since Plant Kraft was retired in late 2015, exempting it from the requirements of the federal CCR rule. The Site location is shown in Figure 1.

The Site is adjacent to two other permitted solid-waste disposal facilities: one to the east and the other to the south (Figure 1). The closed Clifton Rental Company, Inc., Landfill (Clifton Landfill; Permit No. 025-030D(L)) is east, hydraulically upgradient of and cross gradient to the Site. Based on available information, Clifton Landfill was not constructed with a synthetic liner or leachate collection system (which was consistent with GA EPD requirements at the time of construction), and waste extends below the water table. As described in previous reports (ACC 2019a; Anchor QEA 2019), strong physical and geochemical evidence supports the mobilization of arsenic and molybdenum by landfill leachate coming onto the Site from the adjacent Clifton Landfill. This could contribute a source of arsenic (and, by geochemical inference, molybdenum) from Site soils. The active Savannah Regional Industrial Landfill (SRIL) operated by Republic Services, Inc. (Permit No. 025-072D(L)), is south of the Site and hydraulically downgradient of both Clifton Landfill and the Site. SRIL is constructed with a synthetic liner and leachate collection system meeting the requirements specified in GA EPD Rule 391-3-4-.14.

The Site consists of four parcels—A, B1, B2, and B3—comprising approximately 33 acres, as shown in Figure 2. Closure of the Site has been completed in accordance with the landfill permit and performance standards listed in 40 CFR 257.102(d)(3) and adopted by GA EPD Rule 391-3-4-.10(7). Parcels A and B1 were initially closed in 2004, and Parcels B2 and B3 were closed in 2017 (SCG 2007; Brantley Engineering 2017). A new final cover system over Parcel A', the portion of Parcel A outside the original closure area, was installed in 2019 to meet the requirements of GA EPD Rule 391-3-4-.10(7) (Brantley Engineering 2019). The final closure Certification Report was submitted to GA EPD on November 25, 2019 (Brantley Engineering 2019). The Site is permitted under Solid Waste Handling Permit No. 025-061D(LI).

1.2 Nature and Extent

1.2.1 Current SSL Status

Groundwater monitoring has been performed at the Site since 2000, in accordance with a state permit. Assessment monitoring was initiated in 2005 under the state program. Since that time, additional investigations and landfill closures have been performed, the conceptual site model (CSM)

has been updated based on additional investigations, and ACMs have been prepared and updated (for example, *Assessment of Corrective Measures – 2019 Addendum* [ACC 2019a]). A summary of groundwater monitoring and site investigations can be found in the most recent ACM Report for the Site (Anchor QEA 2020).

Under GA EPD regulations applicable to the Site (GA EPD Rule 391-3-4.10(6)(a)), background sampling occurred between 2016 and 2018. Groundwater detection monitoring began following completion of background sampling, with the first sampling event occurring in March 2019. Statistically significant increases of 40 CFR 257 Appendix III constituents were noted as described in the *Supplemental 2019 First Semiannual Groundwater Monitoring Report* (ACC 2019b). The Appendix III statistically significant increases triggered assessment sampling for 40 CFR 257 Appendix IV constituents. Subsequent monitoring verified Appendix IV constituents arsenic and molybdenum at SSLs that exceeded groundwater protection standards (GWPSs). Recurring SSLs that exceeded the GWPS for arsenic (0.029 milligrams per liter [mg/L]) and molybdenum (0.01 mg/L) during the most recent (September 2021) assessment monitoring are summarized as follows (ACC 2022):

- Arsenic GWPS exceedances were identified at monitoring wells GWC-15, GWC-16, and GWC-20.
- Molybdenum GWPS exceedances were identified at monitoring wells GWC-1, GWB-4R, GWC-14, GWC-15, GWC-16, and GWC-20.

Based on GA EPD guidance, wells with SSLs were further evaluated by Groundwater Stats Consulting using the Sen's Slope/Mann-Kendall trend test (Appendix B). The full report generated from the analyses is provided in Appendix D of the *2021 Semiannual Groundwater Monitoring and Corrective Action Report* (ACC 2022). Statistically significant trends were identified for the following well/constituent pairs:

- Increasing trends: GWC-15/arsenic, GWC-16/molybdenum
- Decreasing trends: GWC-1/molybdenum

Pursuant to 40 CFR 257.96, groundwater at the Site continues to be monitored in accordance with the established assessment monitoring program while potential corrective measures are evaluated (ACC 2022). Monitoring well locations are shown in Figure 3.

1.2.2 Geochemistry and Influence of Adjacent Clifton Landfill

Arsenic and molybdenum have been detected at elevated concentrations in monitoring wells at the boundary between the Site and the adjacent closed Clifton Landfill. Based on previous studies, leachate-impacted groundwater from the adjacent Clifton Landfill migrates onto the Site, impacting monitoring wells at the Site. A multisite potentiometric surface contour map using August 2021 data

is shown in Figure 4. Site-specific potentiometric surface contours from the September 21, 2021, gauging event is shown in Figures 5 and 6. The leachate-impacted groundwater contains elevated dissolved organic carbon, which induces reducing groundwater conditions that drive the reductive dissolution of iron oxides present in the subsurface solid matrix and subsequent release of associated species (e.g., arsenic and molybdenum). Iron oxides are naturally present in soils as grain coatings and are also a significant component of ash. Iron oxides are a host phase for many trace elements, including arsenic and molybdenum. Based on soil samples previously collected at the Site, the iron oxide content of ash is higher than that of the background soils.

SSLs of arsenic and molybdenum appear to be due to mobilization by the landfill leachate-impacted groundwater migrating onto the Site. As leachate-impacted groundwater travels beneath the Site, reductive dissolution of iron oxides releases arsenic and molybdenum that are adsorbed on and coprecipitated in the iron oxides naturally present in soils and ash. Arsenic and molybdenum concentrations increase along the groundwater flow path and are highest near the hydraulically downgradient southeast corner of the Site (Figures 5 and 6).

The study summarized in the previously submitted *Arsenic Mobilization Laboratory Evaluation* (Anchor QEA 2019) and the Site conditions suggest that control of leachate impacts to groundwater from the Clifton Landfill would be expected to greatly reduce groundwater arsenic (and, by geochemical inference, molybdenum) concentrations at the Site. Similarly, groundwater corrective actions for arsenic and molybdenum will likely not be effective until leachate from the Clifton Landfill is controlled.

1.2.3 Current Delineation Status

Isoconcentration maps that show the interpreted extent of arsenic and molybdenum, as well as the posted data from the September 2021 semiannual sampling are shown in Figures 5 and 6. The applicable laboratory analytical report for this data is provided in Appendix C. Appendix B shows concentration versus time graphs for wells with SSLs of arsenic or molybdenum.

Vertical delineation of arsenic and molybdenum in groundwater beneath the Site has been achieved (ACC 2022). Data from the August 2021 semiannual monitoring event at SRIL indicate arsenic is horizontally delineated below the GWPS by upgradient SRIL wells GWA-6 and GWC-12B, just south of the Site (CEC 2021). Horizontal delineation of molybdenum was completed using a groundwater flow and reactive transport model (transport model; Anchor QEA 2021a; Figure 7), which was submitted to GA EPD on November 19, 2021. Based on the transport model submitted in November 2021 to GA EPD, molybdenum is horizontally delineated to below the GWPS just north of the southern boundary of SRIL. The transport model has been submitted to GA EPD in its entirety (Anchor QEA 2021a) and is only summarized herein. A neighbor notification was submitted to

Republic Services, Inc., on September 25, 2020, notifying it of these arsenic and molybdenum detections.

Details regarding current statistical analysis, nature, and extent are provided in Sections 4 and 5, respectively, of the *2021 Semiannual Groundwater Monitoring and Corrective Action Report* (ACC 2022).

1.2.4 Transport Model

In support of the previously submitted ACM Report (Anchor QEA 2020), a transport model was developed and submitted to GA EPD for the purposes of off-site delineation of molybdenum concentrations in groundwater south of the Site (Anchor QEA 2021a).

The transport model simulates shallow groundwater flow and reactive transport processes within the near-surface aquifer system (Section 4) beneath the Site. The transport model simulates 41 years (i.e., 1980 to 2021). The earliest record of ash being placed at the Site is 1980; thus, 1980 was chosen as time zero for the transport model. The transport model was validated using Site groundwater concentration data at monitoring wells GWC-15, GWC-16, and GWC-20 located along the southern or southeastern borders of the Site and SRIL wells GWA-6 and GWA-12B located south of the Site along the northern border of SRIL. Results show both the iron oxide concentration within the ash and effective porosity have a strong influence on the arrival time and overall magnitude of arsenic concentrations but that simulated arsenic concentrations can be matched to observed concentrations at wells GWC-15, GWC-16, GWC-20, GWA-6, and GWA-12B within the range of simulated effective porosity and iron oxide concentration of ash.

The findings from the transport model showed molybdenum concentrations in groundwater above the Site GWPS that originate from the Site have likely migrated a short distance beneath but not reached the southern boundary of SRIL (Anchor QEA 2021a). An isoconcentration contour map depicting simulated molybdenum concentrations exceeding the Site GWPS (0.01 mg/L) and federal rule specified level (RSL; 0.1 mg/L) after 41 years of migration (i.e., 1980 to 2021) is presented in Figure 7. This figure depicts the overall extent of simulated concentrations exceeding the Site and federal RSL based on the four scenarios included in the sensitivity analysis, which provides a conservative estimate of the overall extent of current impacts based on the data available for this transport model. The simulated concentrations shown in Figure 7 overestimate the extent of molybdenum to the southeast as it is delineated by SRIL upgradient well GWA-12B. Figures 6 and 7 differ slightly due to the model sensitivity of iron oxide concentration. As discussed in the modeling report (Anchor QEA 2021a), model results are most sensitive to the concentration of iron oxide within the ash beneath Parcel A and the effective porosity of the near-surface aquifer. The delineation was bounded by using Site data (Figure 6) to form a range of possible values for lower and higher iron oxide concentrations ranging between 390 and 820 milligrams per kilogram (mg/kg)

and effective porosity values between 18% and 22%. (As discussed in the transport validation and sensitivity analyses sections of the *Transport Modeling Report* [Anchor QEA 2021a], this range of iron oxide concentrations provides the best match of simulation results to Site data).

Additional details on the groundwater model are presented in the *Transport Modeling Report*.

1.3 Well Survey Update

As requested by GA EPD, a potable well survey within a 2-mile radius of the Site consisting of reviewing federal, state, and county records, and online sources was conducted. A potable well survey was completed in 2020 by NewFields (NewFields 2020). No new wells were identified in the 2022 survey. The NewFields and 2022 potable well surveys are attached in Appendix D. The USEPA Office of Drinking Water and the Georgia Department of Community Affairs did not respond to requests for information.

2 Summary of Work Completed

This section is intended to summarize the field investigations, laboratory studies, and data evaluations completed at the Site since the issuance of the prior July 2021 progress reports (Anchor QEA 2021b). Routine semiannual groundwater monitoring events were conducted by Atlantic Coast Consulting, Inc., in September 2021 and discussed in the *2021 Semiannual Groundwater Monitoring and Corrective Action Report* (ACC 2022).

The supplemental activities presented include the following two broad components:

- Bench-scale treatability studies to assess the performance of in situ methods for removal of arsenic and molybdenum from groundwater
- Geochemical studies consisting of desktop and laboratory studies to further assess the viability of MNA and geochemical approaches as corrective measures

Field efforts, including the collection of groundwater and well solids (precipitates) samples for geochemical evaluations, as well as slug testing and installation of transducers for long-term water level monitoring to support the transport model, were previously documented in the July 2021 *Semiannual Remedy Selection and Design Progress Report* (Anchor QEA 2021b). The results of the slug testing are presented as part of the transport model (Anchor QEA 2021a), which is summarized in Section 1.2.4.

2.1 Site Materials Sampling and Characterization

2.1.1 Aquifer Solid Samples

Site aquifer solids (soil) were collected for the bench-scale treatability studies, baseline characterization, and MNA evaluation. The aquifer solids (soil) were collected in December 2020 and January 2021 during the construction of the four vertical delineation wells on the southern and eastern boundaries of Parcel A (MW-23D, MW-24D, MW-25D, and MW-27D). Samples were collected at depths corresponding with the well screen interval of adjacent wells with GWPS exceedances for arsenic and molybdenum and from deeper, unimpacted depths within Unit 3. Unit 1 and Unit 3 sands are hydraulically connected in these areas. Therefore, Unit 3 is available for attenuation. To characterize the complete attenuation capacity of the aquifer and variability of the aquifer, shallow and deep samples were used in the studies. The aquifer solids (soil) samples were homogenized at the Anchor QEA Environmental Geochemistry Laboratory (EGL) and retained at the

EGL for analysis or subsamples submitted to external laboratories for additional analyses as described below:

- Total organic carbon and total sulfide (Apex Laboratories)[1]
- Soil oxidant demand (Prima Environmental)
- Chemical extractions for extractable iron and manganese oxides (EGL)
- X-ray fluorescence (XRF) for total arsenic, molybdenum, iron, and manganese (EGL)

Aquifer solids (soil) characterization results are summarized in Table 2. Analytical data reports for the soil characterization are included in Appendix C.

2.1.2 Groundwater Samples

Groundwater samples used in treatability studies were collected from two wells (GWC-15 and GWC-20) that have elevated concentrations of arsenic and molybdenum. Groundwater samples were collected in May 2021 by Anchor QEA field staff and described in the July 2021 *Semiannual Remedy Selection and Design Progress Report* (Anchor QEA 2021b). Groundwater samples were collected, stored, and processed under anaerobic conditions. Samples were submitted to ALS in Kelso, Washington, for analysis of total and dissolved arsenic, molybdenum, iron, and manganese, and total and dissolved organic carbon, sulfide, arsenic speciation, and major ion chemistry (calcium, magnesium, sodium, potassium, chloride, nitrate, sulfate, phosphate, silica, and alkalinity). Water quality parameters (pH, oxidation reduction potential, and conductivity) were determined under a nitrogen atmosphere. Groundwater characterization results are summarized in Table 3. Groundwater characterization analytical reports are included in Appendix C

2.2 Bench-Scale Treatability Studies

Bench-scale testing was performed to assess the site-specific performance of several in situ methods for arsenic and molybdenum removal from groundwater, including the following: 1) aeration, with and without iron addition to promote iron oxidation and adsorption/coprecipitation of arsenic and molybdenum; 2) chemical oxidation, with and without iron addition, to promote iron oxidation and adsorption and coprecipitation of arsenic and molybdenum; and 3) biogenic sulfide fixation, with and without iron addition, to promote precipitation of sulfide minerals and the concurrent sequestration of arsenic and molybdenum.

2.2.1 Aeration

Two common aeration methods, air sparging and diffuse aeration, were evaluated. Both methods were tested with and without iron addition, to assess whether iron levels in groundwater are

[1] Organic carbon, sulfide, oxygen, iron, and manganese can significantly influence the geochemical behavior of arsenic and molybdenum.

sufficient to achieve treatment objectives. Air sparging (continuous bubble stream) and diffusive aeration (e.g., using a Waterloo Emitter) were tested. Ferrous sulfate was added to a subset of tests such that the additional iron was 10 or 100 times the initial molar arsenic concentrations. Bench-scale tests were sampled at 1, 2, 4, and 8 days, with duplicate samples collected for the final sampling event (8 days). Treated groundwater was submitted to ALS for analysis of total and dissolved arsenic, molybdenum, iron, and sulfate. The pH, oxidation reduction potential, and conductivity were measured at each time point.

The precipitates that formed during aeration were recovered from the Day 8 samples and are being analyzed by high-resolution scanning electron microscopy (SEM) with elemental analysis to determine the mineralogy and chemical composition of the precipitates. SEM results will include a high-resolution image of the precipitates and major element mapping (such as iron and aluminum). Based on the elemental mapping and/or morphology (shapes) of the precipitates, smaller areas will be selected for electron diffraction, which is performed in conjunction with the SEM imaging. Electron diffraction produces spectra showing chemical composition and relative amounts of the constituents. For example, based on the anticipated sequestration mechanisms, areas composed primarily of iron minerals will be analyzed by electron diffraction to determine if they are enriched in arsenic and molybdenum, as would be expected for successful treatment. The results of the precipitate analyses are anticipated to be included in the next progress report, scheduled for July 2022.

2.2.2 Chemical Oxidation

In the chemical oxidation treatability studies, three common oxidants (peroxide, permanganate, and persulfate) were tested at three different doses. The doses were determined by accounting for the stoichiometric oxygen demand from total organic carbon and iron (adjusted for additions). Oxidant was added at the calculated stoichiometric demand, as well as half and five times the demand. Persulfate oxidation was performed with and without iron addition at 10 and 100 times the initial molar arsenic concentration. Peroxide oxidation was performed with iron addition at 10 and 100 times the initial molar arsenic concentration. Permanganate oxidation was performed without iron addition, as manganese oxide precipitation was expected to remove arsenic and molybdenum.

The treated groundwater was sampled in duplicate after a two-day reaction period and submitted to ALS for analysis of total and dissolved arsenic, molybdenum, and iron; dissolved manganese; and sulfate. Oxidation reduction potential, pH, and conductivity were measured for each sample.

The precipitates that formed during oxidation were recovered from the Day 2 samples and are being analyzed by SEM with elemental analysis to determine the morphology and chemical composition of the precipitates. The results of the precipitate analyses are anticipated to be included in the next progress report, scheduled for July 2022.

2.2.3 Biogenic Sulfide Fixation

In biogenic sulfide fixation, sulfate, iron, and a source of labile organic carbon are added to the groundwater. Naturally occurring bacteria in the aquifer material convert the sulfate to sulfide, which reacts with iron and trace elements (such as arsenic and molybdenum) in groundwater to precipitate as relatively stable sulfide minerals. The formation of the sulfide minerals removes arsenic and molybdenum from groundwater and thereby sequesters them in the solid phase.

Bench-scale incubations for biogenic sulfide fixation were performed on slurries of Site soil and groundwater. Anaerobic groundwater and soil slurry microcosms were prepared at a liquid-to-solid ratio of 10:1 and incubated in the dark. Molasses was added as a readily available carbon source to promote bacterial metabolism. The microcosms were performed without iron addition, or with either 10 or 100 times the initial molar arsenic concentration iron added as ferrous sulfate. The microcosms were sampled at 1, 3, 7, 14, and 28 days, and the treated groundwater was submitted to ALS for analysis of total and dissolved arsenic, molybdenum, and iron; dissolved manganese; and sulfate. Duplicate samples were collected after 28 days of incubation. The pH, oxidation reduction potential, and conductivity were measured at each time point.

The solids were recovered from the 28-day samples and analyzed by X-ray diffraction (XRD), XRF, SEM, and selective sequential extraction (SSE) to determine solid-phase associations of sequestered arsenic and molybdenum. The SSE activities and results are discussed in Sections 2.2.1 and 3.2.1. The results of the SEM analyses are anticipated to be included in the next progress report, scheduled for July 2022.

2.3 Geochemical Studies for MNA

Characterization activities to evaluate attenuation mechanisms at the Site include collection of data necessary to progressively evaluate the existing and long-term effectiveness of these processes in the aquifer and reduce uncertainty for decision-making at each of the following screening steps as listed in the USEPA guidelines for MNA. In 2007, USEPA issued MNA technical guidance specific to inorganic contaminants (USEPA 2007a, 2007b) that contained four “tiers.” The 2015 MNA guidance for inorganic contaminants expands on and is designed to be a companion to the 1999 MNA guidance (USEPA 1999). The 2015 document retains these four “tiers” but describes them as “phases” as follows (USEPA 2015):

- Phase I: demonstration that the groundwater plume is *not expanding*
- Phase II: determination that the *mechanism and rate* of the attenuation process are sufficient
- Phase III: determination that the *capacity* of the aquifer is sufficient to attenuate the mass of contaminant within the plume and that the *stability* of the immobilized contaminant is sufficient to resist remobilization

- Phase IV: design of a *performance monitoring program* based on an understanding of the mechanism of the attenuation process and establishment of contingency remedies tailored to site-specific characteristics

Georgia Power will address Phase IV, as appropriate, during the development of the future corrective action monitoring plan, after the final remedy selection report.

Geochemical evaluations for suitability of MNA at the Site included the following:

- XRF to determine the chemical composition of the matrix (e.g., iron, aluminum, manganese, etc. compounds) and presence of detectable arsenic and molybdenum
- XRD to determine crystalline mineral phases
- SSE to determine association of arsenic and molybdenum with attenuating phases, determine relative strength of attenuation, and provide insight into stability
- Column tests using Site aquifer solids (soil) and impacted groundwater to document arsenic and molybdenum removal from groundwater and uptake capacity of the soils under flow conditions, and provide a basis for estimating the natural attenuation capacity of the aquifer
- Groundwater geochemical equilibrium modeling (including Eh-pH diagrams and saturation index calculations) to help determine solid phases attenuating arsenic and molybdenum under Site conditions

Additional detail (including the relevance of each analysis to the MNA evaluation) is included in Table 4. Cation exchange capacity (CEC) to assess cation exchange as a mechanism for attenuation and SEM to directly observe and determine the composition of attenuating phases (well solids only, not soil) is currently being performed. The results from these analyses will be provided in the next progress report, scheduled for July 2022.

2.3.1 XRF, XRD, and SSE Analyses

The well solids (precipitates) and aquifer solids (soil) samples collected in December 2020 through March 2021 were submitted under chain of custody protocol to EGL. Well solids (precipitates) samples were collected from all shallow Site wells. Aquifer solids (soil samples) were collected from MW-23D through MW-25D and MW-27D. Upon arrival at EGL, samples were stored under refrigeration until processing. The well solids were recovered from the sample filters in a glove box under a nitrogen atmosphere to prevent oxidation prior to analysis for geochemical characterization. The well solids accumulated on the filters were scraped and collected in centrifuge tubes. The wet samples were centrifuged, and the resulting solids were then transferred into a pre-weighed glass jar. The solids were then dried under a nitrogen atmosphere at 38°C for 24 to 72 hours until dry.

All well solids (precipitates) samples with sufficient mass and all aquifer solids (soil) were analyzed by XRF to determine bulk chemical composition. After drying, processed samples were loaded and

sealed in plastic sample containers for elemental analysis by XRF. XRF testing was performed by EGL staff using a Niton XL3t GOLDD+ XRF Analyzer. Individual samples were analyzed by XRF using the "Test All Geo" method under the "Mining" profile, which includes most elements heavier than sodium.

Powder XRD analysis was performed on selected well solids (precipitates) and aquifer solids (soil) samples to determine mineralogy. Samples were selected based on several factors, including well location; groundwater chemistry; bulk chemical composition data (XRF); and, for well solids samples, available sample mass.

Based on the results of XRF and XRD analyses (e.g., iron content), SSE was performed on the well solids (precipitates) and aquifer solid (soil) samples with sufficient volume to measure the distribution of arsenic and molybdenum bound to solid phases from most soluble (F1) to most stable (F5). Samples were extracted stepwise with chemical solutions of increasing aggressiveness into fractions, which are operationally defined as follows:

- F1: water soluble
- F2: exchangeable (e.g., bound to clay minerals)
- F3: reducible (e.g., associated with amorphous or poorly crystalline oxides such as ferrihydrite, a hydrous iron oxide)
- F4: strong acid oxidizable (e.g., associated with crystalline oxide and/or sulfide minerals)
- F5: residual (e.g., bound in insoluble silicate phases)

Each successive step generally represents stronger attenuation and greater stability of arsenic and molybdenum and attenuating solids.

2.3.2 Column Test Studies

Column tests were performed using Site soil and impacted groundwater to do the following:

- Determine the extent to which Site soil can attenuate arsenic and molybdenum from groundwater.
- Gain insight into the attenuating mechanisms and stability of solids attenuating arsenic and molybdenum by performing SSE on post-column-test soil samples.
- Generate attenuation capacity data that can be extrapolated to the entire volume of aquifer available for attenuation to determine if the aquifer has sufficient capacity to attenuate the mass of arsenic and molybdenum in groundwater.

In the column studies, impacted groundwater is pumped through Site soil packed in columns (Figures 8 and 9), and the concentration of arsenic and molybdenum is measured in effluents taken from the columns at regular intervals. If the soil is attenuating arsenic and molybdenum, then arsenic

and molybdenum concentrations will decrease in the effluents until the soil's capacity for attenuation is reached.

Groundwater from monitoring well GWC-15 was used as the influent for the column tests. This well was selected for column testing based on its relatively high arsenic and molybdenum concentrations, to provide high mass loading to the soils. Upon receipt, the groundwater samples were submitted to ALS for chemical analysis prior to beginning the column testing. Analytical results are summarized in Table 5 and included in Appendix C. Eight column tests were performed with eight Site aquifer solids (soil) samples collected from four borings located along the southern and eastern perimeter of the Site. These included shallower and deeper soil intervals corresponding approximately to the screened interval depths of adjacent shallow and vertical delineation monitoring wells: MW-23D 18'-20', MW-23D 46'-48', MW-24D 22'-24', MW-24D 58'-60', MW-25D 20'-22', MW-25D 62'-64', MW 27D 20'-22', and MW-27D 66'-68' (Figure 3; Table 6). These sample depths were selected to provide information on arsenic and molybdenum attenuation capacity of soil both within the shallow (impacted) and deeper groundwater zones. Because Units 1 and 3 are hydraulically connected in these areas, Unit 3 soils are available for attenuation. The laboratory column test setup is shown in Figure 8, and a detailed schematic is provided in Figure 9.

Column tests were carried out in 22-centimeter (cm)-long, 4.2-cm-diameter polycarbonate columns. The Site soils were packed into the columns to achieve a total depth of 15.0 cm. Site groundwater was pumped in an upflow direction through the columns at a flow rate of approximately 0.5 milliliter per minute for 25 days (approximately 250 to 350 pore volumes [PVs]) using a peristaltic pump with a multichannel pump head. Flow rates were regularly checked and adjusted as needed to maintain a constant flow rate. The influent reservoir was purged with nitrogen and kept in sealed Mylar bags with oxygen-absorbing packets during the column tests. Table 7 provides a summary of the column test operating conditions.

The initial concentration of arsenic in GWC-15 groundwater (164 micrograms per liter [µg/L]; Table 5) was slightly less than but within the same order of magnitude of historical arsenic concentrations from samples collected during 2020 and 2021 (averaging 226 µg/L). Although arsenic concentrations in the influent reservoir gradually decreased over time during the column test (from 164 to 107 µg/L), probably due to iron precipitation in the reservoir, significant arsenic mass loading to the Site soils was achieved for the duration of the column tests. The molybdenum concentration in GWC-15 groundwater was initially measured as 123 µg/L (Table 5). Column influent molybdenum concentrations remained at similar levels as the initial concentration for the duration of the column tests.

Column influents and effluents were sampled periodically over the duration of the tests, and pH was measured at the time of sampling. The samples were filtered using 0.45-micron nylon syringe filters and preserved with nitric acid for metals analysis. Flow rates and cumulative flow volumes were also

recorded for each column at the time of sampling to calculate the total number of PVs treated. The column influent and effluent samples were analyzed for dissolved arsenic and molybdenum by USEPA method 200.8 (inductively coupled plasma mass spectrometry) at ALS.

The laboratory column tests were operated at a higher linear velocity (1.7 feet per day) than the groundwater flow conditions in the vicinity of the Site, which range from 0.11 to 0.32 foot per day (ACC 2022). As a result, the hydraulic residence time in the columns was shorter than the hydraulic residence time at the Site. The attenuation measured in the columns, therefore, provides a conservative (lower) estimate of the attenuation in the field.

2.3.3 Geochemical Stability and Speciation Calculations

Geochemical modeling was performed to determine mineral phases that may be controlling the dissolved concentrations, mobility, and attenuation of arsenic and molybdenum, as well as the behavior of other species (such as iron) that influence the behavior of arsenic and molybdenum. The Geochemist's Workbench software (Bethke and Yeakel 2013) was used to construct Pourbaix (Eh-pH) diagrams for iron, arsenic, and molybdenum (based on Site groundwater chemistry data collected in March 2021) to assess the geochemical stability of phases potentially controlling arsenic and molybdenum concentrations under Site conditions. Geochemical speciation-solubility calculations were also performed using the U.S. Geological Survey computer program PHREEQC (Parkhurst and Appelo 2013) with the WATEQ4F thermodynamic database (augmented with molybdenum species from the MINTEQv4 database) to determine the saturation state of groundwater samples (collected in March 2021) with respect to possible mineral phases.

3 Summary of Results

3.1 Bench-Scale Treatability Study Results

As noted in Section 1 and the ACM Report (Anchor QEA 2020), potential corrective measures being considered for the Site include geochemical approaches, such as in situ injection. Treatability testing was performed to evaluate the applicability of this potential remedy, specifically to evaluate arsenic and molybdenum removal from groundwater by aeration, chemical oxidation, and biogenic sulfate reduction. Summary analytical data are provided in Appendix E. The analytical laboratory data reports are provided in Appendix C.

The results, discussed in more detail in the following subsections, are summarized as follows:

- Aeration in the presence of iron was effective for the removal of both arsenic and molybdenum to values less than the respective GWPSs.
- Chemical oxidation with permanganate reduced groundwater concentrations of both arsenic and molybdenum to values less than the respective GWPSs.
- Chemical oxidation with persulfate or hydrogen peroxide was effective for arsenic treatment in the presence of iron (concentrations were reduced to below the GWPS); however, molybdenum removal was limited.
- Biogenic sulfide generation was effective for arsenic removal to concentrations less than the GWPS, but removal of molybdenum was limited.

In summary, these results indicate that groundwater treatment with either aeration with iron addition or chemical oxidation using permanganate would be effective treatment for arsenic and molybdenum. The pending high-resolution SEM analyses of the precipitates that formed during the bench-scale testing are anticipated to be included in the next progress report, scheduled for July 2022.

3.1.1 Aeration

Aeration with the addition of iron removed arsenic to below the GWPS. At an iron addition of 1,000 times the initial molar concentration of arsenic, molybdenum was also removed to below the GWPS. Both the passive aeration and bubbler methods were effective at treating arsenic and molybdenum when sufficient iron was added. Percent removals of arsenic and molybdenum for the aeration are summarized in Table 8.

3.1.2 Chemical Oxidation

Chemical oxidation with peroxide or persulfate was effective at removing arsenic to less than the GWPS with the addition of iron at 10 or 100 times the initial molar arsenic concentration, but molybdenum removal was limited for these treatments. Oxidation with permanganate removed

greater than 99% of both arsenic and molybdenum to concentrations below the respective GWPSs. The percent reductions in arsenic and molybdenum concentrations for groundwater using the different chemical oxidation treatments are summarized in Table 9.

3.1.3 Biogenic Sulfide Incubations

The biogenic sulfide incubations removed arsenic from groundwater to concentrations below the GWPS without iron addition; however, there was minimal removal of molybdenum in the incubations that did not have added iron. With iron addition, approximately half of the groundwater concentrations of arsenic and molybdenum were removed; however, this was not sufficient to bring the concentrations below GWPSs. The limited removal with iron addition is likely due to the acidic pH of the incubations when ferrous sulfate was added. Percent removals of arsenic and molybdenum for the biogenic sulfide incubations are summarized in Table 10.

3.2 Geochemical Studies Results for MNA

The laboratory analytical results from the September 2021 routine groundwater sampling event are presented in the *2021 Semiannual Groundwater Monitoring and Corrective Action Report* (ACC 2022) and Appendix C.

Isoconcentration maps and graphs of concentration versus time were made to determine if the area of the plume is stable or shrinking (USEPA's Phase I for MNA). The September 2021 isoconcentration maps for arsenic and molybdenum for Site wells are presented in Figures 5 and 6. The distribution and concentrations of arsenic and molybdenum for the September 2021 sampling event is generally consistent with the March 2021 event (Anchor QEA 2021b) and the recent years before then. Concentration versus time graphs (trend tests) for arsenic and molybdenum in wells with SSLs are shown in Appendix B. The graphs show that concentrations of arsenic and molybdenum in most wells with SSLs are either stable or decreasing during recent sampling events. Arsenic concentrations in downgradient SRIL wells GWA-6 and GWC-12B are consistently below the detection limit, indicating that the lateral extent of arsenic impacts is not expanding.

3.2.1 XRF, XRD, and SSE Evaluations

3.2.1.1 Well Solids (Precipitates)

The XRF chemical analysis of the well solids (precipitates; Table 11) showed relatively high concentrations of iron and aluminum (up to 6.8 weight % and 7.8 weight %, respectively). XRF results showed a positive correlation of arsenic with iron (Figure 10) and molybdenum with iron (Figure 11). The high-arsenic/low-iron point in Figure 10 may represent attenuation by solids in the well precipitates that contain little or no iron.

XRD identified quartz, feldspars, and muscovite/illite as the major constituent minerals in the well solids (precipitates), with minor components of clay (mainly kaolinite) and trace oxides (Table 12). The quartz, feldspars, muscovite/illite, and kaolinite likely are fine particulate relicts from the aquifer matrix that passed through the well screens. Amorphous (poorly crystalline) metal oxides are not discernible by XRD.

Based on the results from the XRF and XRD analyses and available sample volume, samples were selected and analyzed for SSE. Table 13 and Figure 12 show the results of SSE for six well solids samples from the Site. Iron is detected in primarily in the F4 (oxidizable) and F5 (residual) fractions, and less in the F3 (reducible) and F2 (exchangeable) fractions. Arsenic and molybdenum are detected primarily in the F2 (exchangeable) fraction, less in the F4 (oxidizable) fraction, and much less in the F1 (water soluble), F3 (reducible), and F5 (residual) fractions.

3.2.1.2 Aquifer Solids (Soil)

XRF analysis of aquifer soil samples show moderate to high total iron content in the range of 1,579 to 11,027 mg/kg, generally consistent with the well solids samples (Table 14). The mineralogy of the aquifer solids (soil) samples (as determined by XRD) consists predominantly of quartz and feldspars with muscovite-illite, clay minerals (dominantly bentonite and kaolinite), and, except for one very low detection, no crystalline iron oxide minerals (Table 15). However, amorphous (non-crystalline) iron oxides, which are often present in soils but undetectable by XRD, could provide ample capacity for attenuation of arsenic and molybdenum.

SSE was performed on the eight Site aquifer solids (soils) used in the column uptake experiments (Table 13 and Figure 13) to help determine the attenuating mechanisms and stability of arsenic and molybdenum and their hosts. Much of the post-column SSE data were below detection limits due to the lab having to dilute those samples prior to analysis due to matrix interference. However, for detected data (bold in Table 13), the arsenic was in the F4 (strong acid oxidizable) and F5 (residual) fractions. Arsenic was not detected in the remaining fractions. Molybdenum concentrations were mostly in the F2 (exchangeable) and F4 (strong acid oxidizable) fractions, with lesser concentrations in the F5 (residual) fraction. Except for one value for molybdenum in MW-25D (20 to 22 feet below ground surface), arsenic or molybdenum were not detected in the F1 (water soluble) fraction. Iron, which is a major constituent of mineral phases that can take up and attenuate arsenic and molybdenum, was detected in all fractions except for F1 (water soluble), primarily in the F4 (strong acid oxidizable) and F5 (residual) fractions, and less in the F3 (reducible) and F2 (exchangeable) fractions, similar to the well solids SSE results. The F3 (reducible) and F4 (strong acid oxidizable) fractions are associated with iron oxides and indicate attenuation potential for sorption of arsenic and molybdenum.

3.2.2 Column Test Results

Column test results for arsenic and molybdenum are summarized in Table 16 and shown in Figures 14 through 17. Results are plotted as the concentration ratio of effluent to influent as a function of PVs of groundwater passed through each column. Analytical summary reports are included in Appendix C.

Overall, Site soils attenuated arsenic. The attenuating capacity of arsenic in all the Site soils was significant. Soils continued to remove between approximately 70% to 95% of influent arsenic, even after 300-350 PV of flow (Figure 14). The minimum measured arsenic uptake by soils was 8 to 10 mg/kg, with excess capacity for attenuation still remaining at the end of the column tests (Figure 15). The attenuating capacity of molybdenum in the Site soils was variable. Removal capacity was reached after approximately 10 to 100 PV in the deeper soils, while shallower soils generally did not remove molybdenum and appeared to be at capacity (Figure 16). The attenuation capacity of deeper soils (MW-24D 58'-60' and MW-27D 66'-68') for molybdenum was approximately 1.5 mg/kg (Figure 17).

3.2.3 Geochemical Stability and Speciation Results

Using The Geochemist's Workbench software, Pourbaix (Eh-pH) diagrams for iron, arsenic, and molybdenum were constructed based on Site groundwater chemistry data collected in March 2021 to assess the geochemical stability of phases potentially controlling arsenic and molybdenum concentrations under Site conditions[2] (Figures 18 through 20, respectively). Blue fields indicate dissolved/mobile species, and tan fields indicate solid/attenuated species. Eh-pH data from the March 2021 groundwater sampling event are also plotted to determine the most stable species under Site conditions. The Pourbaix stability diagrams indicate the following associations and attenuating mechanisms:

- Site Eh-pH data fall along or near[3] the thermodynamic stability boundaries between amorphous hydrous iron oxide [$Fe(OH)_3(a)$] and dissolved ferrous iron [Fe^{2+}], from which the presence of iron oxides in the aquifer can be inferred as a major control on Eh-pH conditions (Figure 18). Amorphous iron oxides are strong sorbents for many metals and metalloids, including arsenic and molybdenum.
- A majority of Site Eh-pH data, including those downgradient of Parcel A, also plot within the stability field of a barium arsenate mineral phase [$Ba_3(AsO_4)_2$], which may control dissolved

[2] Detailed assumptions used to construct Eh-pH diagrams are included in Figures 18 through 20.

[3] Limits of stability fields on Eh-pH diagrams are approximate and can shift slightly due to changes in groundwater chemistry. The interpretation of field redox measurements (Eh) is also difficult due to lack of equilibrium between all redox couples in natural systems. However, in many groundwater systems, Eh-pH data often reflect the status of iron redox equilibria and are useful for assessing the stability of iron oxides, which attenuate trace elements such as arsenic and molybdenum by adsorption.

arsenic concentrations in areas where barium concentrations exceed those of arsenic (Figure 19).

- Molybdenum concentrations do not appear to be controlled by precipitation of any molybdenum mineral phases under existing Site conditions (Figure 20). Eh-pH data support attenuation of molybdenum on iron oxides because some of the data plot within the hydrous iron oxide [$Fe(OH)_3(a)$] stability field (Figure 20), which is consistent with the column test results (Section 3.2.2).

Geochemical speciation-solubility calculations were also performed to calculate aqueous speciation and determine the saturation state of groundwater samples with respect to possible mineral phases. Saturation index calculations are complementary to Eh-pH diagrams and can be used to infer solid phases potentially present in the aquifer based on groundwater chemistry at specific locations within the aquifer. The solubility of these phases may be controlling dissolved concentrations. If a groundwater solution is saturated or supersaturated with respect to a mineral phase, then that phase could be precipitating and attenuating arsenic and molybdenum as it precipitates. Saturation indices for groundwater samples collected in March 2021 are presented in Table 17, and geochemical speciation modeling results indicate the following:

- Groundwater is generally close to equilibrium or slightly undersaturated with respect to the following:
  - Amorphous hydrous iron oxide [$Fe(OH)_3(a)$]
  - Iron carbonate (siderite)
- Groundwater is supersaturated with respect to the more crystalline iron oxides (goethite, hematite, and magnetite).
- Groundwater in monitoring wells downgradient of Parcel A is supersaturated with respect to a barium arsenate mineral phase.
- Groundwater with detectable molybdenum is currently slightly undersaturated but approaches saturation with respect to calcium and iron molybdate mineral phases ($CaMoO_4$ and $FeMoO_4$), indicating higher calcium and/or iron concentrations could result in precipitation of molybdenum.

The geochemical modeling results reflect the reductive dissolution of iron oxides and release of iron, arsenic, and molybdenum in groundwater hydraulically downgradient of the adjacent Clifton Landfill, as well as subsequent attenuation of arsenic and molybdenum downgradient of Parcel A via sorption on iron oxides and potential precipitation of a barium arsenate mineral phase.

4 Updated Conceptual Site Model

The updated CSM discussed in the most recent *Semiannual Remedy Selection and Design Progress Report* (Anchor QEA 2021b) noted that the identified hydrogeological units at the Site consist of four units comprising the near-surface aquifer system. They have been identified as follows:

- Upper Sands and Topsoil Unit—Variably Saturated Zone: silty, fine sand
- Unit 1—Uppermost Aquifer: silty, fine sand
- Unit 2—Low Permeability Zone: interbedded sand, silt, and clay
- Unit 3—Lower Sand Aquifer: silty and/or clayey fine to medium sand

Unit 2 is absent in some areas of the Site, such as along its southern and southeastern parts. The unit acts as a semi-confining unit, where present, impeding downward migration to Unit 3 and creating perched water within Unit 1. Where Unit 2 is absent, however, hydraulic communication does exist between Units 1 and 3. Two cross sections presented in the *Transport Modeling Report* and *Semiannual Remedy Selection and Design Progress Report* (Anchor QEA 2021a, 2021b) are included in Figures 21 and 22. Detailed descriptions of these units are provided in the ACM Report (Anchor QEA 2020) and *Transport Modeling Report* (Anchor QEA 2021a).

The additional data collected since the issuance of the previous semiannual progress report in July 2021 (Anchor QEA 2021b) allow the refinement of the CSM. The following bullets summarize the current understanding of the CSM within the context of selecting an appropriate groundwater corrective measure for the Site:

- As discussed in Section 1.2.3 and 1.2.4, horizontal and vertical delineation at the Site is complete.
  - Arsenic and molybdenum are vertically delineated by onsite monitoring wells.
  - Arsenic is horizontally delineated by upgradient SRIL wells GWA-6 and GWC-12B, just south of the Site (CEC 2021).
  - Molybdenum is horizontally delineated to below the GWPS just north of the southern boundary of SRIL by the transport model.
- Geochemical studies were integrated into the CSM.
  - SSE results for well solids (precipitates) indicate iron is detected primarily in the F4 (strong acid oxidizable) and F5 (residual) fractions, and less in the F3 (reducible) and F2 (exchangeable) fractions. Arsenic and molybdenum are detected primarily in the F2 (exchangeable) fraction, less in the F4 (strong acid oxidizable) fraction, and much less in the F1 (water soluble), F3 (reducible), and F5 (residual) fractions.
  - SSE results for aquifer solids (soil) indicate arsenic is primarily in the F4 (strong acid oxidizable) and F5 (residual) fractions. Arsenic was not detected in the remaining fractions. Molybdenum concentrations were mostly in the F2 (exchangeable) and

F4 (strong acid oxidizable) fractions, with lesser concentrations in the F5 (residual) fraction. Except for one value for molybdenum in MW-25D (20 to 22 feet below ground surface), arsenic and molybdenum were not detected in the F1 (water soluble) fraction. Iron, which is a major constituent of mineral phases that can take up and attenuate arsenic and molybdenum, was detected in all of the fractions except for F1 (water soluble), primarily in the F4 (strong acid oxidizable) and F5 (residual) fractions, and less in the F3 (reducible) and F2 (exchangeable) fractions, similar to the well solids SSE results. The F3 and F4 fractions are associated with iron oxides and indicate attenuation potential for sorption of arsenic and molybdenum.

  - Additional site-specific MNA study results are included in Section 5.1.

- Slug test estimates from spring 2021, described in the *Transport Modeling Report* (Anchor QEA 2021a), are similar to previous estimates from 1998 slug tests (SCS 1998), with the new overall geometric mean for the Site being 2.7 feet per day (ft/d), as opposed to 4.4 ft/d from the 1998 data. However, the new data provide substantially better coverage of horizontal hydraulic conductivity estimates across the Site. Horizontal hydraulic conductivity is generally higher across Parcel A than across the rest of the Site, with a geometric mean across Parcel A of 11.8 ft/d. The geometric mean across the rest of the Site is 1.4 ft/d.

5 Updated Evaluation of Corrective Measures

Closure of the Site and installation of a cover system in 2019 provide source control that reduces the potential for migration of CCR constituents to groundwater. The corrective measures proposed in the ACM Report (Anchor QEA 2020) were further evaluated based on site-specific conditions to address SSLs in groundwater at the Site. Each individual corrective measure was evaluated relative to criteria specified in 40 CFR 257.96(c) and 40 CFR 257.97(b).

An updated comparative evaluation and feasibility assessment of the corrective measures is provided in Table 1, which includes a brief overview of each corrective measure as follows:

- Geochemical approaches
- Hydraulic containment (pump-and-treat)
- ISS
- MNA
- PRB walls
- Phytoremediation
- Subsurface vertical barrier walls

Detailed descriptions of these corrective measures are provided in the July 2021 *Semiannual Remedy Selection and Design Progress Report* (Anchor QEA 2021b).

5.1 Corrective Measures Retained

The following corrective measures are considered feasible and retained for further analyses[4]:

- Geochemical approaches
  - Geochemical approaches involve modifying the geochemistry of the Site to immobilize arsenic and molybdenum on solids created by injection.
  - Based on the results of the bench-scale treatability results presented in Section 3.1, the following specific geochemical approaches are retained for consideration as a corrective remedy:
    - Aeration in the presence of iron: effective in the removal of both arsenic and molybdenum
    - Chemical oxidation with permanganate: effective in the removal of both arsenic and molybdenum

[4] Groundwater corrective actions for arsenic and molybdenum will likely not be effective until leachate from the Clifton Landfill is controlled.

- ISS
  - ISS, also known as deep soil mixing, a method for solidifying soil or waste material, immobilizing arsenic and molybdenum in the solid matrix, and reducing leaching of the constituents to groundwater, continues to be retained as a possible corrective measure.
  - ISS will be evaluated using the Site transport model.
- MNA
  - Based on the MNA evaluation results presented in Section 3.2, MNA continues to be retained as a potential corrective measure.
    - XRF results showed a correlation between arsenic and iron, and molybdenum and iron concentrations.
    - Column testing showed that, overall, Site soils attenuate arsenic and, in some cases, molybdenum.
    - Geochemical stability results show that Site Eh-pH data fall near the thermodynamic stability boundaries for amorphous hydrous iron oxide [$Fe(OH)_3(a)$], which is a strong sorbent for many metals and metalloids, including arsenic and molybdenum.
- Phytoremediation
  - Phytoremediation could provide some hydraulic containment through targeted placement of TreeWells, which function like small pumping wells via transpiration. Phytoremediation using TreeWells will be evaluated using the Site transport model.

5.2 Corrective Measures Not Retained

The following corrective measures are not recommended for further evaluation or implementation due to site-specific conditions:

- Chemical oxidation with persulfate, chemical oxidation with hydrogen peroxide, and biogenic sulfide generation, because these methods proved effective for removal of arsenic but not molybdenum
- Hydraulic containment (pump-and-treat)
- PRB walls
- Subsurface vertical barrier walls, either stand-alone or in conjunction with PRB walls in a funnel-and-gate configuration

Detailed explanation of why the latter three of these corrective measures are no longer retained for consideration are provided in the July 2021 *Semiannual Remedy Selection and Design Progress Report* (Anchor QEA 2021b).

6 Planned Activities and Anticipated Schedule

Georgia Power proactively initiated adaptive site management as outlined in the ACM Report (Anchor QEA 2020) to support the remedial strategy and address potential changes in Site conditions as appropriate. The adaptive site management approach may be adjusted over the Site's life cycle as new Site information and technologies become available. Georgia Power will continue its data collection efforts as necessary to refine the CSM and further evaluate the feasibility of each corrective measure proposed in the ACM Report. The corrective measures that continue to be evaluated are presented in Section 5 and explained in Table 1. Once sufficient data are available to make technically sound decisions regarding the ability to implement one or more specific corrective measures, appropriate steps will be taken to design and implement a remedy for the Site.

Specific activities to be performed during the next semiannual reporting period include the following:

- Continue routine groundwater sampling to analyze and evaluate trends for effectiveness of source control and plume stability; prepare and compare isoconcentration maps through time.
- Continue to evaluate concentration versus time graphs to determine if natural attenuation is already occurring through time. If data are sufficient, estimate time to achieve GWPSs from the graphs.
- As a follow-up to oxygenation treatability studies, perform characterization of precipitates formed during treatability studies to determine composition and stability.
- Complete SEM and CEC analysis to further evaluate MNA.
  - SEM allows direct visual observation and elemental analysis of attenuating phases.
  - CEC determines if ion exchange on clays is a viable attenuating mechanism.
- Evaluate the effectiveness of hydraulic containment using TreeWells.
- Evaluate ISS feasibility and effectiveness.

Table 18 presents these supplemental data collection and evaluation activities proposed to be completed during the next semiannual reporting period. The results of the evaluations are anticipated to be included in the next progress report, scheduled for July 2022.

Georgia Power will continue to prepare semiannual remedy selection progress reports to document groundwater conditions, results associated with additional data gathering, and the progress in selecting and designing the remedy in accordance with 40 CFR 257.97(a). Georgia Power will include future semiannual remedy selection progress reports in routine groundwater monitoring and corrective action reports. Recordkeeping, notifications, and publicly accessible website requirements for the semiannual remedy selection progress reports will be provided in accordance with 40 CFR 257.105(h)(12), 257.106(h)(9), and 257.107(h)(9), respectively.

Evaluation of Remedial Technologies

Corrective Measure	Regulatory Citation for Criteria	40 CFR 257.96(C)(1)			
	Description	Performance	Reliability	Ease or Difficulty of Implementation	Potential Impacts of Remedy
Geochemical approaches (oxidation by physical or chemical means; adsorption to or coprecipitation with iron compounds via injection of treatment chemicals)	Geochemical approaches involve modifying the geochemistry of the Site to immobilize arsenic and molybdenum on solids created by injection. Depending upon the objective and Site geochemical conditions, immobilization may be achieved by oxygenation or injection of the appropriate treatment solutions. Oxygenation may be achieved chemically by injecting oxidants, placing slow-release oxidizing chemical candles in wells, or by physical methods such as air sparging or installation of Waterloo Emitters in wells. Other forms of geochemical approaches (also known as enhanced attenuation) include the injection of treatment solutions to immobilize constituents by precipitation/coprecipitation and/or sorption. The treatment solutions would likely contain iron compounds to create ferrihydrite to sorb arsenic and molybdenum, or to precipitate sulfide minerals, which incorporate arsenic and molybdenum into their mineral structures.	The performance of this remedy is considered medium. Leachate from the Clifton Landfill would need to be controlled for both oxidation and adsorption/coprecipitation to be effective. If not controlled, the reducing characteristics of Clifton Landfill leachate would produce reductive dissolution of iron or other natural or introduced metal oxides, which would release arsenic and molybdenum bound to those oxides.	The reliability of this remedy is considered medium. Multiple injections will likely be required for chemical-based approaches. For physical approaches (such as sparging wells and emitters), mechanical components would need to be maintained.	Implementation of this remedy would be easy to moderate. For chemical approaches, laboratory treatability studies would need to be scaled up to field conditions, injection wells installed, or a system using direct push technology designed. For physical approaches, mechanical components would need to be designed, installed, and maintained.	The unintended release of constituents currently bound to soil is possible if inappropriate treatment chemicals or oxidizing agents are used. Also, treatment chemicals need to be tested for Appendix IV impurities before injection to avoid accidental introduction.
Hydraulic containment (pump-and-treat)	Hydraulic containment uses pumping wells (and sometimes injection wells, trenches, and/or galleries) to contain and prevent the expansion of impacted groundwater by creating a horizontal and vertical capture zone or a hydraulic barrier. If pumped, the water may be reused in beneficial applications or treated, discharged, or reinjected after treatment. Reinjection contributes to hydraulic containment by creating a hydraulic barrier of clean water. Hydraulic containment in various applications (including pump-and-treat) is applicable to arsenic and molybdenum because conventional and proven water treatment technologies are available for arsenic and molybdenum.	Hydraulic containment via pump-and-treat has been used for groundwater corrective action for decades. When the pump-and-treat system is online, the performance is considered high. Arsenic and molybdenum are readily treated, and if the system subsurface hydraulics are designed properly, the area of impact will stabilize or shrink.	Because the pump-and-treat system requires substantial operation and maintenance, reliability is considered medium. Pumps, piping, and the water treatment system must be maintained and will be offline occasionally for various reasons.	Hydraulic containment via pump-and-treat is difficult to implement due to design; installation of wells, pumps, and piping; and space constraints. An on-site water treatment plant would be required to accommodate the quantity and constituents in the pumped groundwater. Because the quantity of water requiring treatment cannot be determined without further study, the design parameters of the treatment system would also need to be verified through additional investigations.	Hydraulic containment via pump-and-treat will alter groundwater-flow hydraulics beneath and adjacent to the Site.
In situ solidification/stabilization	ISS, also known as deep soil mixing, is a method for solidifying soil or waste material, immobilizing constituents of interest in the solid matrix, and reducing leaching of the constituents to groundwater. ISS both reduces permeability and chemically binds constituents of interest such as arsenic and molybdenum. Materials specific to the constituents of interest (e.g., ferrous sulfate or zero-valent iron for arsenic and molybdenum) may be added in small quantities to further reduce leaching of the constituents. In ISS, Portland cement and, sometimes, select chemical additives are mixed with soil or waste material using a bucket, large augers, or rotary methods. At the Site, ISS would be used as a source control measure to solidify/stabilize ash beneath the water table, thereby reducing leaching to groundwater. Due to the ISS application depths required at the Site, mixing by auger is likely the only viable application method.	Performance is considered high, as leaching of constituents can be greatly reduced in both laboratory treatability studies, and subsequent field applications. Site-specific performance would need to be assessed with laboratory treatability and, possibly, a field pilot test.	Reliability is considered high because the stabilized block does not require maintenance and is essentially permanent.	Ease of implementation is considered moderate at the Site because mixing would need to be implemented at depth from the top or slopes of the ash landfill. Depending upon the method of application, a cement batch plant (and associated pumps) may need to be constructed at the Site.	ISS may cause a temporary spike of arsenic and, possibly, molybdenum in groundwater at the time of implementation. This spike is expected to dissipate, and groundwater arsenic and molybdenum concentrations are expected to fall below pre-implementation values with time.

Corrective Measure	Regulatory Citation for Criteria	40 CFR 257.96(C)(1)			
	Description	Performance	Reliability	Ease or Difficulty of Implementation	Potential Impacts of Remedy
MNA	MNA relies on natural attenuation processes (within the context of a carefully controlled and monitored site cleanup approach) to achieve site-specific remediation objectives within a time frame that is reasonable compared to that offered by other, more active, methods. For arsenic and molybdenum, the primary mechanisms of natural attenuation include sorption to iron compounds such as ferrihydrite or iron sulfide minerals, precipitation and coprecipitation with sparingly soluble sulfide minerals and other compounds, and physical processes such as dispersion (USEPA 2007a, 2007b; EPRI 2015). Under favorable conditions, these processes act without human intervention to reduce the mass, toxicity, mobility, volume, or concentration of contaminants in soil or groundwater.	The performance of MNA requires further investigation, especially related to the identification of attenuating mechanisms, aquifer capacity for attenuation, and time to achieve GWPS. The aquifer material at the Site contains significant silt and/or clay, which favors natural attenuation mechanisms such as sorption. However, leachate from the Clifton Landfill is likely mobilizing arsenic and, possibly, molybdenum from ash and natural soil, resulting in a continued source of those constituents to groundwater if not controlled. Therefore, MNA performance is considered medium to high if landfill leachate from Clifton Landfill is controlled.	Reliability of MNA will be relatively high because MNA requires almost no operation and maintenance.	Implementation of MNA at the Site will be relatively easy. Most of the wells for MNA are already in place, though a few additional wells may need to be installed to monitor progress in critical areas.	Potential impacts of the remedy will be negligible because MNA is non-intrusive and produces no effluents or emissions.
PRB wall (containing sorptive media, oxygenation chemicals, or organic matter)	A PRB wall is the emplacement of chemically reactive materials in the subsurface to intercept impacted groundwater, provide a flow path through the reactive media, and capture or transform the constituents in groundwater to achieve GWPS downgradient of the PRB wall. PRB walls are an in situ technology that allows impacted water to flow through the media and provides a barrier to constituents, rather than to groundwater flow, thereby reducing constituents downgradient of the reactive barrier to compliance levels (Powell et al. 1998, 2002). PRB walls may be constructed as funnel-and-gate systems. In a PRB wall implementation, reactive media may be emplaced in a trench or mixed directly with the soil or aquifer media using augers or other mixing techniques. If emplaced in a trench, coarse sand is usually included to maintain permeability through the wall. Effective reactive media are commercially available for arsenic and molybdenum. Depending on the site conditions and the objective of the PRB wall, three types of media could be used: oxygenating chemicals, adsorptive media, or organic matter and chemicals to create sulfide minerals (i.e., a biowall).	When working effectively in suitable conditions, PRB walls can reduce constituents to GWPS downgradient of the walls. However, because of site-specific uncertainties associated with the reactive media and subsurface hydraulics, performance is considered medium to high.	Because the reactive media are expended, may clog through time, and will need to be replaced, reliability is considered medium.	Because it involves trenching or mixing with augers, and due to space constraints, ease of implementation is considered moderate to difficult.	Alteration of subsurface hydraulics (flow) may be a potential impact of this remedy.
Phytoremediation	Phytoremediation uses trees or other plants to take up or immobilize constituents or achieve some level of hydraulic containment. Hyperaccumulating plants are available for arsenic and molybdenum, but the roots of those plants are too shallow to access impacted groundwater at the Site. Some level of hydraulic containment could be achieved at the Site using trees, including the engineered TreeWell system. Transpiration of groundwater causes the TreeWell to act like a pumping well. Trees can affect hydraulic gradients and groundwater flow by removal of water and thus can be used to create a partial barrier to groundwater flow. This process may be enhanced by planting the tree in a column of more permeable material (e.g., the TreeWell system), such that water preferentially flows toward the TreeWell. In addition, some arsenic and molybdenum may be immobilized within the root zone or incidentally taken up into the tree biomass.	The performance of TreeWells is considered medium because the trees may not transpire (pump) enough water to maintain hydraulic containment based on site-specific conditions.	The reliability of TreeWells is considered medium because the trees may not transpire (pump) as much during winter.	Implementation of hydraulic containment using trees will be relatively easy, primarily consisting of constructing the TreeWells and planting the trees.	None have been identified.

Corrective Measure	Regulatory Citation for Criteria	40 CFR 257.96(C)(1)			
	Description	Performance	Reliability	Ease or Difficulty of Implementation	Potential Impacts of Remedy
Subsurface vertical barrier walls (if/as needed as a component of PRB walls or, possibly, hydraulic containment)	Subsurface vertical barrier walls can be used to stop the flow of groundwater and any constituents that groundwater contains, including arsenic and molybdenum. Though effective, vertical barrier walls may serve as groundwater dams such that groundwater rises to the surface or flows around the ends of the wall. Subsurface barrier walls are not envisioned as stand-alone corrective measures at the Site. If they offer advantages, subsurface barrier walls could be a component of PRB walls in a funnel-and-gate configuration or as part of a hydraulic containment system to direct groundwater toward pumping wells.	Subsurface vertical barrier walls are a widely used and accepted technology with relatively high performance.	Subsurface vertical barrier walls are a widely used and accepted technology with relatively high reliability due to minimal need for maintenance or replacement.	Implementation at the Site is considered easy to moderate due to trenching or other emplacement methods.	Potential impacts of the remedy include alteration of subsurface hydraulics (flow) beneath and adjacent to the Site.

Corrective Measure	Regulatory Citation for Criteria	40 CFR 257.96(C)(2)	40 CFR 257.96(C)(3)		Relative Cost	Feasibility
	Description	Time to Begin/Complete Remedy	Institutional Requirements	Other Environmental or Public Health Requirements		
Geochemical approaches (oxidation by physical or chemical means, and adsorption to or coprecipitation with iron compounds via injection of treatment chemicals)	Geochemical approaches involve modifying the geochemistry of the Site to immobilize arsenic and molybdenum on solids created by injection. Depending upon the objective and Site geochemical conditions, immobilization may be achieved by oxygenation or injection of the appropriate treatment solutions. Oxygenation may be achieved chemically by injecting oxidants, placing slow-release oxidizing chemical candles in wells, or by physical methods such as air sparging or installation of Waterloo Emitters in wells. Other forms of geochemical approaches (also known as enhanced attenuation) include the injection of treatment solutions to immobilize constituents by precipitation/coprecipitation and/or sorption. The treatment solutions would likely contain iron compounds to create ferrihydrite to sorb arsenic and molybdenum or to precipitate sulfide minerals, which incorporate arsenic and molybdenum into their mineral structures.	This remedy could be designed and implemented in 1 to 2 years. Once installed, the time required to achieve GWPS within the treatment area may be relatively quick but depends on the attenuation processes of each targeted constituent. The time for complete distribution of the injected materials throughout the treatment area is also variable.	An underground injection control permit may be required for injection of oxidizing agents or treatment chemicals.	Treatability studies, groundwater modeling, and monitoring may be required to demonstrate that unintended impacts (e.g., release of constituents) are not occurring and do not extend off site.	Low to medium due to injection infrastructure, oxidizing agents or treatment chemicals, and mechanical equipment for the physical oxidation techniques	The following are based on treatability studies: • Aeration with iron addition was effective for both arsenic and molybdenum **(feasible)**. • Chemical oxidation using permanganate was effective for both arsenic and molybdenum **(feasible)**, but persulfate or hydrogen peroxide were effective for arsenic only **(not recommended)**. • Biogenic sulfide generation was effective for arsenic only, not molybdenum **(not recommended)**.

Corrective Measure	Regulatory Citation for Criteria	40 CFR 257.96(C)(2)	40 CFR 257.96(C)(3)		Relative Cost	Feasibility
	Description	Time to Begin/Complete Remedy	Institutional Requirements	Other Environmental or Public Health Requirements		
Hydraulic containment (pump-and-treat)	Hydraulic containment uses pumping wells (and sometimes injection wells, trenches, and/or galleries) to contain and prevent the expansion of impacted groundwater by creating a horizontal and vertical capture zone or hydraulic barrier. If pumped, the water may be reused in beneficial applications or treated, discharged, or reinjected after treatment. Reinjection contributes to hydraulic containment by creating a hydraulic barrier of clean water. Hydraulic containment in various applications (including pump-and-treat) is applicable to arsenic and molybdenum because conventional and proven water treatment technologies are available for arsenic and molybdenum.	Pump-and-treat could probably be designed and installed within 1 to 2 years. Based on case histories, time to achieve GWPS is dependent on the desorption kinetics of arsenic and molybdenum from the aquifer solids and could take an extended period of time. If leachate coming from the Clifton Landfill is not controlled, time to achieve GWPS cannot be determined.	Regulatory requirements and institutional controls may be greater for pump-and-treat than some of the other technologies. For example, permits may be required for the withdrawal and reinjection (if used) of water. Discharge of treated water would likely require a National Pollutant Discharge Elimination System permit.	Aboveground treatment components may need to be present for an extended period of time, generating residuals requiring management and disposal.	High	**Not recommended** Hydraulic containment is not recommended for the following reasons: geometry of the Site may not be amenable to effective hydraulic containment due to possible spatial constraints for system installation and the conditions created by adjacent landfills; without control of Clifton Landfill leachate, the Site hydraulic control system may essentially be a treatment system for Clifton Landfill leachate and would operate indefinitely until the landfill leachate is controlled; required installation of a water treatment system and identification of a discharge point for treated water; high operation and maintenance requirements; long time required to achieve GWPS, likely beyond the post-closure period of 30 years; and excessive use of resources (such as electricity and water treatment chemicals), making it one of the least sustainable corrective action options (EPRI 2015).
In situ solidification/stabilization	ISS is achieved by creating reactive zones in the subsurface through chemical injection to intercept constituents and permanently immobilize or degrade them into harmless end products. ISS is the process by which constituent mobility in a solid matrix is decreased through physical and/or chemical means. Grout or other chemical additives are mixed with aquifer materials to reduce permeability. The resulting lower aquifer permeability limits the flow of impacted groundwater.	ISS could be designed and implemented in 1 to 2 years. Laboratory treatability and, possibly, a field pilot test would need to be performed. Time to achieve GWPS is uncertain and may be dependent on natural attenuation processes.	No institutional requirements are expected.	There would be a small disruption of industrial area during construction. Following installation, the remedy is passive.	Medium, due to mobilization and use of large equipment and, possibly, a cement batch plant and associated equipment such as pumps	**Feasible**

Corrective Measure	Regulatory Citation for Criteria	40 CFR 257.96(C)(2)	40 CFR 257.96(C)(3)		Relative Cost	Feasibility
	Description	Time to Begin/Complete Remedy	Institutional Requirements	Other Environmental or Public Health Requirements		
MNA	MNA relies on natural attenuation processes (within the context of a carefully controlled and monitored site cleanup approach) to achieve site-specific remediation objectives within a time frame that is reasonable compared to that offered by other, more active methods. For arsenic and molybdenum, the primary mechanisms of natural attenuation include sorption to iron compounds such as ferrihydrite or iron sulfide minerals, precipitation and coprecipitation with sparingly soluble sulfide minerals and other compounds, and physical processes such as dispersion (USEPA 1999, 2007a, 2007b; EPRI 2015). Under favorable conditions, these processes act without human intervention to reduce the mass, toxicity, mobility, volume, or concentration of contaminants in soil or groundwater.	Implementation of MNA would require some geochemical studies and, possibly, the installation of some new wells. Because MNA does not require design and construction of infrastructure other than new monitoring wells, it can be initiated within 6 months to a year and fully implemented in 18 to 24 months. The longer time period is because initial geochemical studies would need to be performed to support USEPA's phases, and at least 1 year of groundwater monitoring data is recommended before implementation of MNA is considered complete. The additional data would be needed for statistical analysis and to determine if additional monitoring wells need to be installed. MNA is expected to be successful within a reasonable time frame if Clifton Landfill leachate is controlled.	None identified	Little to no physical disruption to remediation areas and no adverse construction-related impacts are expected on the surrounding industrial area. Following installation, the remedy is passive and does not require external energy.	Low	Based on MNA Evaluation to date: **Feasible**
PRB wall (containing sorptive media, oxygenation chemicals, or organic matter)	A PRB wall is the emplacement of chemically reactive materials in the subsurface to intercept impacted groundwater, provide a flow path through the reactive media, and capture or transform the constituents in groundwater to achieve GWPS downgradient of the PRB wall. PRB walls are an in situ technology that allows impacted water to flow through the media and provides a barrier to constituents, rather than to groundwater flow, thereby reducing constituents downgradient of the reactive barrier to compliance levels (Powell et al. 1998, 2002). PRB walls may be constructed as funnel-and-gate systems. In a PRB wall implementation, reactive media may be emplaced in a trench or mixed directly with the soil or aquifer media using augers or other mixing techniques. If emplaced in a trench, coarse sand is usually included to maintain permeability through the wall. Effective reactive media are commercially available for arsenic and molybdenum. Depending on the site conditions and the objective of the PRB wall, three types of media could be used: oxygenating chemicals, adsorptive media, or organic matter and chemicals to create sulfide minerals (i.e., a biowall).	Considering the need for laboratory treatability studies on the reactive media, analysis of the subsurface hydraulics, and the relatively small area of emplacement, time to implement the remedy is estimated to be 1 to 2 years. Once installed, the time to achieve GWPS immediately downgradient of the PRB wall is anticipated to be relatively quick. Time to achieve GWPS more distant from the PRB wall would be dependent on natural attenuation processes.	None identified	There would be a small disruption of industrial area during construction. Following installation, the remedy is passive. If reactive media are not selected carefully through laboratory treatability studies, groundwater geochemistry could be altered (possibly resulting in unintended releases of constituents downgradient of the wall).	Medium	**Not recommended** This is not recommended due to a lack of a continuous, low-permeability confining layer to tie the PRB wall into at depths above the maximum depth investigated (approximately 70 feet bgs), periodic replacement of the reactive media as the media becomes spent or clogged, and inability to address previously impacted groundwater downgradient of wall installation.

Corrective Measure	Regulatory Citation for Criteria	40 CFR 257.96(C)(2)	40 CFR 257.96(C)(3)		Relative Cost	Feasibility
	Description	Time to Begin/Complete Remedy	Institutional Requirements	Other Environmental or Public Health Requirements		
Phytoremediation	Phytoremediation uses trees or other plants to take up or immobilize constituents or achieve some level of hydraulic containment. Hyperaccumulating plants are available for arsenic and molybdenum, but the roots of those plants are too shallow to access impacted groundwater at the Site. Some level of hydraulic containment could be achieved at the Site using trees, including the engineered TreeWell system. Trees can affect hydraulic gradients and groundwater flow by removal of water and thus can be used to create a partial barrier to groundwater flow. This process may be enhanced by planting the tree in a column of more permeable material (e.g., the TreeWell system), such that water preferentially flows toward the TreeWell. Transpiration of groundwater causes the TreeWell to act like a pumping well. In addition, some arsenic and molybdenum may be immobilized within the root zone or incidentally taken up into the tree biomass.	Phytoremediation could be designed and implemented in 6 to 12 months. Hydraulic containment is expected to occur in a reasonable time frame but needs to be calculated based on the number and transpiration rate of the TreeWells.	None identified	Little to no physical disruption to remediation areas and no adverse construction-related impacts are expected on the surrounding industrial area. Following installation, the remedy is passive and does not require external energy.	Low	**Feasible**
Subsurface vertical barrier walls (if/as needed as a component of PRB walls or, possibly, hydraulic containment)	Subsurface vertical barrier walls can be used to stop the flow of groundwater and any constituents that groundwater contains, including arsenic and molybdenum. Though effective, vertical barrier walls may serve as groundwater dams such that groundwater rises to the surface or flows around the ends of the wall. Subsurface barrier walls are not envisioned as stand-alone corrective measures at the Site. If they offer advantages, subsurface barrier walls could be a component of PRB walls in a funnel-and-gate configuration or as part of a hydraulic containment system to direct groundwater toward pumping wells.	Time to implement the remedy (design and construct the wall) could be 1 to 2 years. As a component of PRB walls in a funnel-and-gate configuration or as part of a hydraulic containment system, time to achieve GWPS would be dependent on the other corrective measures.	None identified	There would be some disruption of industrial area during construction. Following installation, the remedy is passive.	Medium	**Not Recommended** This is not recommended due to being contingent on companion technology; see PRB wall implementation discussion above. Also, as with a PRB wall, there is no continuous, low-permeability confining layer to tie into at depths above the maximum depth investigated (approximately 70 feet bgs).

Table 4
Geochemical Analysis of Monitoring Well and Aquifer Solids

Analysis	Description	Relevance to MNA Demonstration
CEC	Determines if cation exchange on clays is an attenuating mechanism.	Supports Tier 2 (mechanisms) and Tier 3 (stability) of cation exchange.
SEM	Allows direct visual observation of attenuating phases, such as framboidal pyrite and iron oxide coatings on sand grains.	Supports Tier 2 (mechanisms) and Tier 3 (stability) of attenuating phases.
SSE	Determines which attenuating solid phases are associated with constituents of interest.	Supports Tier 2 (mechanisms) and Tier 3 (stability) of attenuating phases.
XRD	Identifies and provides mineralogy of crystalline attenuating phases.	Supports Tier 2 (mechanisms) and Tier 3 (stability) of attenuation involving crystalline mineral phases.
XRF	Provides bulk chemistry and presence of constituents of interest.	Relationships are determined among elements in attenuating phases (e.g., iron and manganese) and constituents of interest. Supports Tier 2 (mechanisms) and Tier 3 (stability).

Notes:

CEC: cation exchange capacity

MNA: monitored natural attenuation

SEM: scanning electron microscopy

SSE: selective sequential extraction

XRD: X-ray diffraction

XRF: X-ray fluorescence

Table 5
Initial Groundwater Characterization Results for Column Test Studies

Parameter	Result	Unit
	GWC-15	
Alkalinity	277	mg/L as $CaCO_3$
Ammonia as N	0.254	mg/L
Total organic carbon	25.9	mg/L
Chloride	4.41	mg/L
Fluoride	0.01 U	mg/L
Nitrate as N[1]	0.04 J	mg/L
Nitrite as N	0.006 U	mg/L
Orthophosphate	0.02 U	mg/L
Sulfate	71.1	mg/L
Aluminum, dissolved	59	µg/L
Aluminum, total	61	µg/L
Antimony, dissolved	7 U	µg/L
Arsenic, dissolved	164	µg/L
Barium, dissolved	46.3	µg/L
Beryllium	0.3 U	µg/L
Boron, dissolved	756	µg/L
Cadmium, dissolved	0.4 U	µg/L
Calcium, dissolved	103	mg/L
Chromium, dissolved	2.1 U	µg/L
Cobalt, dissolved	0.7 U	µg/L
Iron, dissolved	1,420	µg/L
Iron, total	1,470	µg/L
Lead, dissolved	3 U	µg/L
Lithium, dissolved	6 U	µg/L
Magnesium, dissolved	19.6	mg/L
Manganese, dissolved	298	µg/L
Manganese, total	298	µg/L
Molybdenum, dissolved	123	µg/L
Nickel, dissolved	1.4 J	µg/L
Potassium, dissolved	11.3	mg/L
Selenium, dissolved	7 U	µg/L
Silicon, dissolved	0.78	mg/L
Silver, dissolved	2.1 U	µg/L
Sodium, dissolved	7.37	mg/L
Thallium, dissolved	4 U	µg/L
Zinc, dissolved	0.5 U	µg/L
pH	6.60	--

Notes:

Samples were field filtered with a 0.45-micron filter at the time of collection and filtered again prior to analysis for dissolved constituents.

Samples for column test studies were collected in March 2021.

1. Calculated as: (nitrogen, nitrate + nitrite) - (nitrogen, nitrite)

--: not applicable

µg/L: micrograms per liter

$CaCO_3$: calcium carbonate

J: indicates the result is an estimated value

mg/L: milligrams per liter

N: nitrogen

U: indicates a non-detect at the method detection limit

Table 6
Site Aquifer Solids (Soil) and Groundwater Used in Column Tests

Column Number	Soil ID[1]	Groundwater ID	Constituents in Groundwater
1	MW-23D 18-20	GWC-15	Arsenic and molybdenum
2	MW-23D 46-48		
3	MW-24D 22-24		
4	MW-24D 58-60		
5	MW-25D 20-22		
6	MW-25D 62-64		
7	MW-27D 20-22		
8	MW-27D 66-68		

Note:

1. In the column studies, impacted groundwater is pumped through Site soil packed in columns, and the concentration of arsenic and molybdenum is measured in effluents taken from the columns at regular intervals. If the soil is attenuating arsenic and molybdenum, then arsenic and molybdenum concentrations will decrease in the effluents until the soil's capacity for attenuation is reached. These sample depths were selected to provide information on arsenic and molybdenum attenuation capacity of soil, both within the shallow (impacted) and deeper groundwater zones. Because Units 1 and 3 are hydraulically connected in these areas, Unit 3 soils are available for attenuation.

Table 7
Column Test Operating Conditions

Parameter	Value	Unit
Soil/sand mixture depth	15	cm
Column inside diameter	4.2	cm
Flow rate	0.50	mL per minute
Empty bed contact time[1]	6.92	hours
Porosity	25–33	%
Dry mass of soil in column	247.5–338.9	grams
Hydraulic residence time[2]	1.74–2.31	hours
Linear velocity[3]	1.7	feet per day
Darcy flux[4]	0.43–0.56	feet per day
Column test duration	25	days

Notes:

1. Volume of empty column bed (V) divided by flow rate (Q)
2. Pore volume (volume of empty column bed (V) × porosity (ø)) divided by flow rate (Q)
3. Flow rate (Q) divided by cross-sectional area of a column (A)
4. Linear velocity multiplied by porosity (ø)

cm: centimeter

mL: milliliter

Table 8

Arsenic and Molybdenum Removal by Aeration with Iron Addition

Groundwater	Aeration Method	Iron Addition[1]	Arsenic Removal (%)	Molybdenum Removal (%)
GWC-15	Bubbler	100x	**97.1**	--
		1000x	**98.3**	**99.9**
	Diffusion	100x	**97.7**	--
		1000x	**98.8**	**99.9**
GWC-20	Bubbler	100x	**95.9**	--
		1000x	**98.9**	**99.8**
	Diffusion	100x	**96.3**	--
		1000x	**99.7**	**99.7**

Notes:

Bold indicates the concentration is less than the groundwater protection standards: 29 µg/L arsenic or 10 µg/L molybdenum.

1. Iron addition is calculated from the initial molar arsenic concentration.

--: indicates an increase in concentration

µg/L: micrograms per liter

Table 9
Arsenic and Molybdenum Removal by Chemical Oxidation

Treatment	Dose[1]	Iron Addition[2]	GWC-15		GWC-20	
			Arsenic Removal (%)	Molybdenum Removal (%)	Arsenic Removal (%)	Molybdenum Removal (%)
Peroxide	0.5	10x	**91.3**	--	**95.5**	5.5
	1		**92.3**	--	**91.1**	5.5
	5		**88.2**	--	**88.8**	3.8
	0.5	100x	**99.5**	--	**99.3**	6.4
	1		**99.6**	--	**99.4**	6.5
	5		**99.5**	--	**99.4**	6.6
Permanganate	0.5	None	**98.7**	***99.1***	**98.9**	***99.9***
	1		**99.1**	***99.1***	**98.9**	***99.9***
	5		**99.1**	***99.1***	**98.9**	***99.9***
Persulfate	0.5	None	5	--	5.1	7.6
	1		11.2	--	2.5	--
	5		17.5	--	19.7	--
	0.5	10x	77.4	--	**86.6**	--
	1		83.7	--	**88.6**	0.5
	5		**91.7**	--	**88.7**	--
	0.5	100x	**97.4**	***16.8***	**99.2**	30.5
	1		**98.4**	***16.8***	**99.0**	30.4
	5		**99.1**	***18.5***	**99.2**	29.1

Notes:

Bold indicates the concentration is less than the groundwater protection standards: 29 µg/L arsenic or 10 µg/L molybdenum.

Bold Italics indicates the concentration is less than the rule-specified level: 100 µg/L molybdenum.

1. Oxidant was added at 0.5, 1, or 5 times the stoichiometric dose calculated from the total reduced species in groundwater.

2. Iron addition is calculated from the initial molar arsenic concentration.

--: indicates an increase in concentration

µg/L: micrograms per liter

Table 10
Arsenic and Molybdenum Removal by Biogenic Sulfate Reduction

Groundwater	Iron Addition[1]	Arsenic Removal (%)	Molybdenum Removal (%)
GWC-15	None	**98.8**	--
	100x	44.9	***33.7***
	1000x	42.6	***26.2***
GWC-20	None	**99.3**	--
	100x	40.1	54.2
	1000x	42	55.7

Notes:

Bold indicates the concentration is less than the groundwater protection standards: 29 µg/L arsenic or 10 µg/L molybdenum.

Bold italics indicates the concentration is less than the rule-specified level: 100 µg/L molybdenum.

1. Iron addition is calculated from the initial molar arsenic concentration.

--: indicates an increase in concentration

µg/L: micrograms per liter

Notes:

Bold indicates positive SI values (i.e., groundwater supersaturated with respect to mineral phase).

SIs are for groundwater samples collected in March 2021.

--: No SI calculated because one or more constituent(s) in phase was not detected in the groundwater sample.

$Ba_3(AsO_4)_2$: barium arsenate

$BaMoO_4$: barium molybdate

$CaMoO_4$: calcium molybdate

$FeMoO_4$: iron molybdate

$Fe(OH)_3(a)$: hydrous iron oxide

SI: saturation index

Table 18
Proposed ACM Supplementary Data Collection and Analysis Tasks

Task/Data Collection Event	Applicable CM	Applicability/Rationale	Field Component	Parameters of Interest	Analytical Laboratory Performing Analysis
Continue routine groundwater sampling.	1, 2, 3, and 4	Analyze and evaluate trends for effectiveness of source control and plume stability.	Semiannual routine groundwater sampling	Arsenic and molybdenum	Laboratory analysis performed by Pace Analytical Services, LLC.
Determine if area of impacts is stable or shrinking.	2	First requirement (phase) for MNA: MNA may not be met until leachate from the Clifton Rental Company, Inc., Landfill (closed) is controlled.	No additional field component; work with groundwater monitoring data as it becomes available.	Prepare concentration versus time graphs for arsenic and molybdenum, apply statistics to graphs to demonstrate statistically significant decreases, compute rates of decrease, prepare isoconcentration maps, compute decrease in area through time, and apply Ricker Method.	Desktop analysis performed by Anchor QEA, LLC, using existing data.
Determine if the Unit 1 aquifer has sufficient capacity to attenuate the mass of arsenic and molybdenum in the existing plumes and determine time to achieve GWPSs.	2	Second requirement (phase) for MNA: determine the mechanisms and rates of the attenuation process	No additional field work	Arsenic and molybdenum	Desktop analysis performed by Anchor QEA using existing data. This includes computing the mass of arsenic and molybdenum in the plumes, computing attenuation capacity of the aquifer based on the column studies, and comparing the two results. Use projections from concentration versus time graphs and/or transport model to determine time to achieve GWPSs.
Continue treatability studies.	1 and 2	Site geochemical data indicate that reductive dissolution of iron is mobilizing arsenic and molybdenum. Introduction of oxygen into the system is expected to mitigate release of arsenic and molybdenum. Based on previous work, the addition of iron compounds to groundwater may also create solids that remove arsenic and molybdenum from groundwater.	No additional field component; use samples collected in spring 2021.	Arsenic, molybdenum, and iron: the precipitates that formed during aeration testing were recovered and analyzed by high-resolution SEM with elemental analysis to determine the morphology and composition of the precipitates. The solids evaluation analytical results are pending and will be completed in early 2022.	Laboratory analysis performed at Anchor QEA's Environmental Geochemistry Laboratory in Portland, Oregon.
Complete SEM and CEC analysis.	2	SEM allows direct visual observation and elemental analysis of attenuating phases; CEC determines if ion exchange on clays is a viable attenuating mechanism.	No additional field work	Arsenic and molybdenum	Laboratory analysis performed at RC Imaging in Portland, Oregon.
Evaluate hydraulic containment feasibility using TreeWells.	3	Determine number, placement, and pumping rate of trees to stabilize plume.	No additional field work	Arsenic and molybdenum	Desktop analysis performed by Anchor QEA.
Evaluate ISS feasibility.	4	Determine location, depth, volume, probable mixtures, and feasibility; develop treatability studies plan (if needed).	No additional field work	Arsenic and molybdenum	Desktop analysis performed by Anchor QEA.

Notes:
CM codes:
1. geochemical approaches (injections and in situ oxidation)
2. MNA
3. TreeWells
4. ISS
ACM: assessment of corrective measures
CEC: cation exchange capacity
CM: corrective measure
GWPS: groundwater protection standard
ISS: in situ solidification/stabilization
MNA: monitored natural attenuation
SEM: scanning electron microscopy

NOTES:

1. Grumman Road Private Industrial Landfill arsenic data are from the September 2021 routine semiannual sampling event. Groundwater contours were provided by Atlantic Coast Consulting, Inc. *2021 Semiannual Groundwater Monitoring and Corrective Action Report.* Grumman Road Private Industrial Landfill. Prepared for Georgia Power Company. Febuary 2022.
2. Savannah Regional Industrial Landfill arsenic data (wells GWA-6 and GWA-12B) are from the August 2021 semiannual sampling event.
3. Concentrations are reported in mg/L.
4. Site background concentration for arsenic is 0.029 mg/L and is the site-specific groundwater protection standard.
5. The groundwater protection standard was calculated using data through the September 2021 sampling event.
6. Groundwater elevations are in feet MSL.
7. MW-23D, MW-24D, MW-25D, MW-26D, and MW-27D were not used to create the isocontour.
8. Aerial imagery is from Esri basemap service (source date: February 21, 2020).

<: Indicates the constituent was analyzed for but not detected above the method detection limit.
J: Reported value is an estimate because concentration is less than reporting limit and greater than the method detection limit.

RE: Project: GRUMMAN ROAD LANDFILL RADS
Pace Project No.: 92563306

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on September 24, 2021. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Nicole D'Oleo
nicole.d'oleo@pacelabs.com

QUALIFIERS

Project: GRUMMAN ROAD LANDFILL RADS
Pace Project No.: 92563306

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Act - Activity

Unc - Uncertainty: SDWA = 1.96 sigma count uncertainty, all other matrices = Expanded Uncertainty (95% confidence interval). Gamma Spec = Expanded Uncertainty (95.4% Confidence Interval)

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

Laboratory receiving samples:
Asheville ☐ Eden ☐ Greenwood ☐ Huntersville ☐ Raleigh ☐ Mechanicsville ☐ Atlanta ☑ Kernersville ☐

Sample Condition Upon Receipt

Client Name: GA power

Project #: WO# : 92563306

92563306

Courier: ☐ Fed Ex ☐ UPS ☐ USPS ☑ Client ☐ Commercial ☐ Pace ☐ Other: ____

Custody Seal Present? ☐ Yes ☑ No **Seals Intact?** ☐ Yes ☑ No

Date/Initials Person Examining Contents: MS 9/24/

Packing Material: ☐ Bubble Wrap ☐ Bubble Bags ☐ None ☑ Other

Biological Tissue Frozen? ☐ Yes ☑ No ☐ N/A

Thermometer: ☐ IR Gun ID: 230 ☑ IR ☐ Blue ☐ None

Type of Ice:

Cooler Temp: 5.3 **Correction Factor: Add/Subtract (°C)** ±0.1

Temp should be above freezing to 6°C
☐ Samples out of temp criteria. Samples on ice, cooling process has begun

Cooler Temp Corrected (°C): 5.4

USDA Regulated Soil (☐ N/A, water sample)
Did samples originate in a quarantine zone within the United States: CA, NY, or SC (check maps)? ☐ Yes ☑ No

Did samples originate from a foreign source (international shipments including Hawaii and Puerto Rico)? ☐ Yes ☑ No

					Comments/Discrepancy:
Chain of Custody Present?	☑ Yes	☐ No	☐ N/A	1.	
Samples Arrived within Hold Time?	☑ Yes	☐ No	☐ N/A	2.	
Short Hold Time Analysis (<72 hr.)?	☐ Yes	☑ No	☐ N/A	3.	
Rush Turn Around Time Requested?	☐ Yes	☑ No	☐ N/A	4.	
Sufficient Volume?	☑ Yes	☐ No	☐ N/A	5.	
Correct Containers Used?	☑ Yes	☐ No	☐ N/A	6.	
-Pace Containers Used?	☑ Yes	☐ No	☐ N/A		
Containers Intact?	☑ Yes	☐ No	☐ N/A	7.	
Dissolved analysis: Samples Field Filtered?	☑ Yes	☐ No	☐ N/A	8.	
Sample Labels Match COC?	☑ Yes	☐ No	☐ N/A	9.	
-Includes Date/Time/ID/Analysis Matrix: GW					
Headspace in VOA Vials (>5-6mm)?	☐ Yes	☐ No	☑ N/A	10.	
Trip Blank Present?	☐ Yes	☐ No	☑ N/A	11.	
Trip Blank Custody Seals Present?	☐ Yes	☐ No	☑ N/A		

COMMENTS/SAMPLE DISCREPANCY

Field Data Required? ☐ Yes ☐ No

RE: Project: GRUMMAN ROAD LANDFILL
Pace Project No.: 92563313

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on September 24, 2021. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Charlotte
- Pace Analytical Services - Peachtree Corners, GA

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Nicole D'Oleo

Project: GRUMMAN ROAD LANDFILL
Pace Project No.: 92563313

QC Batch: 649417
QC Batch Method: EPA 300.0 Rev 2.1 1993
Analysis Method: EPA 300.0 Rev 2.1 1993
Analysis Description: 300.0 IC Anions
Laboratory: Pace Analytical Services - Asheville

Associated Lab Samples: 92563313018, 92563313019, 92563313020, 92563313021, 92563313022, 92563313023, 92563313024, 92563313025, 92563313026, 92563313027, 92563313028, 92563313029, 92563313030, 92563313031, 92563313032

METHOD BLANK: 3406135 Matrix: Water

Associated Lab Samples: 92563313018, 92563313019, 92563313020, 92563313021, 92563313022, 92563313023, 92563313024, 92563313025, 92563313026, 92563313027, 92563313028, 92563313029, 92563313030, 92563313031, 92563313032

Parameter	Units	Blank Result	Reporting Limit	MDL	Analyzed	Qualifiers

QUALIFIERS

Project: GRUMMAN ROAD LANDFILL
Pace Project No.: 92563313

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

B	Analyte was detected in the associated method blank.
D3	Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

RE: Report of Findings, Measurement of Potassium Permanganate and Sodium Persulfate SOD
Client ID: A1F1062.
PRIMA ID: Apex-Anchor

Dear Mr. Thomas:

This letter report describes the results of the soil oxidant demand (SOD) measurement conducted by PRIMA Environmental, Inc on soil samples from your site. The oxidants used were potassium permanganate ($KMnO_4$) and sodium persulfate (SP). Oxidant demand was measured at a single timepoint (48 hours).

Sample Receipt and Preparation

Two soil samples were received on June 30, 2021. Sample volume was extremely limited. Samples were stored at 4-7°C.

Materials

Potassium Permanganate, $KMnO_4$. Reagent grade $KMnO_4$ was used in this study. Dilute solutions were prepared as needed by dissolving the appropriate amount of solid $KMnO_4$ in deionized (DI) water.

Sodium Persulfate, SP. Klozur® brand sodium persulfate was obtained from Peroxychem (www.peroxychem.com). Concentrated stock solutions were prepared as needed by dissolving the appropriate amount of solid SP in deionized (DI) water.

Procedures

$KMnO_4$ SOD. For each soil, three vials containing 5 g soil and 10 mL of $KMnO_4$ solution were prepared. Each vial contained a different initial concentration of $KMnO_4$: 1,000, 5,000 mg/L or 20,000 mg/L $KMnO_4$. The vials were placed on a shaker table. At

5070 Robert J. Mathews Parkway, Suite 300, El Dorado Hills, CA 95762
Ph (916) 939-7300 • Fax (916) 939-7398
www.primaenvironmental.com

approximately 48 hours, the vials were destructively sampled and the residual $KMnO_4$ was measured colorimetrically by PRIMA. The SOD is the mass of oxidant consumed, divided by the amount of soil used in the test.

Sodium Persulfate SOD. For each soil, two reactors were set. Each reactor contained 10 g soil and 20 mL of either a low (5 g/L) or high (15 g/L) dose of SP. The reactors were placed on a shaker table. At approximately 48 hours, the reactors were destructively sampled and the residual SP was measured using FAS/KMnO4 titration. The SOD is the mass of oxidant consumed, divided by the amount of soil used in the test.

Results

$KMnO_4$ SOD. The results of the $KMnO_4$ SOD test are shown in **Table 1**. $KMnO_4$ was completely consumed by MW-27 20-22 soil, indicating that the SOD is greater than 40,400 mg $KMnO_4$/kg soil. For 23/24/25 Comp, the SOD was 30,400 mg $KMnO_4$/kg.

SP SOD. The results of the SP SOD test are shown in **Table 2**. SOD ranged from 3.8 to 8.0 g SP/kg soil for MW-27 20-22 and from 1.2 to 4.0 g SP/kg soil for 23/24/25 Comp. Increased SOD with increasing initial concentration of SP is a common phenomenon.

If you have any questions regarding these results, please give me a call at 916-939-7300. Thank you for the opportunity to be of service.

Sincerely,
PRIMA Environmental, Inc.

Cindy G. Schreier, Ph.D.
President

Suite 750
Portland, OR 97204

RE: Grumman Road

Dear Jessica,

Enclosed are the results of the sample(s) submitted to our laboratory May 18, 2021
For your reference, these analyses have been assigned our service request number **K2105528.**

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3376. You may also contact me via email at Mark.Harris@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated value.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.
H	The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

#	The control limit criteria is not applicable. See case narrative.
J	The result is an estimated value.
E	The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
M	The duplicate injection precision was not met.
N	The Matrix Spike sample recovery is not within control limits. See case narrative.
S	The reported value was determined by the Method of Standard Additions (MSA).
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
W	The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
+	The correlation coefficient for the MSA is less than 0.995.
Q	See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
A	A tentatively identified compound, a suspected aldol-condensation product.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
C	The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
D	The reported result is from a dilution.
E	The result is an estimated value.
J	The result is an estimated value.
N	The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
P	The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

F	The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
L	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
H	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
O	The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
Y	The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
Z	The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.
Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/anlayte is offered by that state.

Date Received: 05/18/2021

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples for the Tier level IV requested by the client.

Sample Receipt:

Two ground water samples were received for analysis at ALS Environmental on 05/18/2021. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The samples were stored at minimum in accordance with the analytical method requirements.

Metals:

No significant anomalies were noted with this analysis.

Cooler Receipt and Preservation Form

Client _____ Service Request (SR) _____

Received _____ Opened _____ By _____ Unwrapped _____ By _____

1	Samples arrived in:	USPS	FedEx	UPS	DHL	FDX	Courier	Hand Delivered
2	Samples were received in a cooler:	Cooler	Box	Envelope	Other		N/A
3	Were custody seals on cooler?	N/A	Y	N	If yes, how many and where:		
	If present, were intact and signature and date?		Y	N	If present, were they broken upon receipt?		Y N
4	Were temperature blank samples received?	N/A	Y	N	Place temperature blank in the appropriate cooler below		
	If no, state the temperature of refrigerated samples not accompanied by a temperature blank in the cooler where the samples were received: Sample Temp						
5	Were samples received within the method-specified temperature range?					N/A	Y N
	Did samples arrive in good condition and were they properly preserved? (If not, notify the PM)					N/A	Y N

*If applicable, how samples were received: Ranger Portable Freezer Filtered

Temp Blank	Sample Temp	IR Gun	Cooler #/COC ID # N/A	Out of temp indicate with "X"	PM Notified if out of temp	Tracking Number N/A	Tag

6 Was sample taken in: Bottle Reagent Bottle Rinse Acid Washed Filter for Dry Ice Other

7	Were custody papers properly filled out (ink, signed, etc.)?	N/A	Y N
8	Were sample containers in good condition (no breakage)?	N/A	Y N
9	Were all sample labels complete (analysis, preservation, etc.)?	N/A	Y N
10	Did all sample labels and tags agree with custody papers?	N/A	Y N
11	Were appropriate bottles/containers and volumes received for the tests indicated?	N/A	Y N
12	Were the pH-preserved bottles (VOAs, HAs, etc.) checked at the appropriate rate? (Not applicable to bottles received at least 24 hours after collection)	N/A	Y N
13	Were VOA vials free of visible headspace? (Bubbles in the vial are not acceptable)	N/A	Y N
14	Was a 10% Bleach rinse required?	N/A	Y N

Sample ID on Bottle	Sample ID on COC	Identified by:

Analytical Report for Service Request No: K2105532

Jessica Goin
Anchor QEA, LLC
421 SW Sixth Ave.
Suite 750
Portland, OR 97204

RE: Grumman Road Treatability

Dear Jessica,

Enclosed are the results of the sample(s) submitted to our laboratory May 18, 2021
For your reference, these analyses have been assigned our service request number **K2105532.**

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3376. You may also contact me via email at Mark.Harris@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated value.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.
H	The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

#	The control limit criteria is not applicable. See case narrative.
J	The result is an estimated value.
E	The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
M	The duplicate injection precision was not met.
N	The Matrix Spike sample recovery is not within control limits. See case narrative.
S	The reported value was determined by the Method of Standard Additions (MSA).
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
W	The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
+	The correlation coefficient for the MSA is less than 0.995.
Q	See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
A	A tentatively identified compound, a suspected aldol-condensation product.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
C	The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
D	The reported result is from a dilution.
E	The result is an estimated value.
J	The result is an estimated value.
N	The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
P	The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

F	The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
L	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
H	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
O	The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
Y	The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
Z	The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.
Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/anlayte is offered by that state.

Sample Matrix: Soil, Ground Water

Service Request: K2105532
Date Received: 05/18/2021

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples for the Tier level IV requested by the client.

Sample Receipt:

Eleven soil, ground water samples were received for analysis at ALS Environmental on 05/18/2021. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The samples were stored at minimum in accordance with the analytical method requirements.

Metals:

No significant anomalies were noted with this analysis.

General Chemistry:

Method 300.0, 05/18/2021: All samples in this delivery group were received past holding time. The analysis was performed as soon as possible after receipt by the laboratory. The data was flagged to indicate the holding time violation.

Method 365.3, 05/18/2021: All samples in this delivery group were received past holding time. The analysis was performed as soon as possible after receipt by the laboratory. The data was flagged to indicate the holding time violation.

Method 9030M, 05/19/2021: All samples in this delivery group were received past holding time. The analysis was performed as soon as possible after receipt by the laboratory. The data was flagged to indicate the holding time violation.

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

	Yes	No	N/A
Comments			
1. Holding times met by all samples analyzed?	[illegible]		
2. Are calibrations within upper limits of the curve?	[illegible]	[illegible]	
3. Method Blanks analyzed (required)?	[illegible]	[illegible]	
a. Does QC [illegible] apply?	[illegible]		
4. Are detection limits calculated correctly?	[illegible]		
5. Are quality control criteria met?	[illegible]	[illegible]	[illegible]
a. Method Blanks, CCVs, CCSs, LCSs, Dups and Spikes analyzed at the proper frequency?			
b. Are CCVs and CCSs within acceptance limits?	[illegible]	[illegible]	[illegible]
c. Are results for Method Blanks in ND?	[illegible]		[illegible]
d. Are QC samples within acceptance limits? (LCSs, Dups, MS/MSDs, PDSs, etc.)			
e. Are [illegible] acceptable?	[illegible]		
6. Are samples [illegible] correctly?	[illegible]	[illegible]	[illegible]

CAM Standard Operating Procedure Exceptions and Anomalies Report for Ion Chromatography

G1: Sample analysis [illegible] recommended holding time. See [illegible] worksheet.
G2: Sample [illegible] analyzed past holding time. The sample was [illegible] within recommended holding time.
G4: Sample [illegible] Date/Time of Collection and Recommended Holding Time.
R1: High RSD. Analytical [illegible] sample [illegible] the [illegible] reporting limit.
1: [illegible] Dilution [illegible] and the sample [illegible] holding.
1: Sample [illegible] primary [illegible]

Yes No N/A

Comments

1. Holding times met for all samples analyzed? [illegible]
2. Are calibrations within upper and lower limits?
3. Were blanks free of contamination?
   a. Does ICCB blank apply?
4. Are calibration curves fit to data correctly?
5. Are all QC results within limits?
   a. Method Blanks, CCVs, CCBs, LCSs, Dups and Spikes analyzed at the proper frequency?
   b. Are CCVs and CCBs within acceptance limits?
   c. Are results for Matrix Spikes in ND?
   d. Are all QC samples within acceptance criteria? (LCSs, MSs, Dup, Spike, MPDs, etc.)
   e. Are all corrective actions taken?
6. Are all barcodes and ID numbers correct?

CAS Standard Semi-Volatile Codes and Abbreviations Footnotes for Ion Chromatograms

G1 Sample was analyzed past the end of recommended holding time. See Narrative for explanation.
G2 Sample was analyzed past holding time. Data analysis was performed within recommended holding time.
G4 Sample was received past the end of recommended holding time.
R1 High RPD. Sample is the QC. Data flag due to results are less than 5 times the RL for the QC holding time.
I MDL is elevated because of matrix interferences and the sample requires diluting.
F Sample [illegible] of analysis.

Sequence [illegible] Ion Chromatography Data Quality Review

	Yes	No	N/A
1. Holding times met for all samples analyzed?			
2. Are all ions within upper and lower limits of the curve?			
3. Were Dual Column analyses performed?			
a. Does CCV and CCB/IV apply?			
4. Are Retention Times within acceptable range?			
5. Are all quality control criteria met?			
a. Method Blanks, CCVs, CCBs, LCSs, Duplicates and Spikes analyzed at the proper frequency?			
b. Are CCVs and CCBs within acceptable range?			
c. Are results for Method Blanks acceptable?			
d. Are all QC parameters met (acceptable recovery, RSDs, RPDs, etc.)?			
e. Are all expected QC results present?			
6. Are all samples able to be accurately quantified?			

DAS Standards and Criteria Codes and Abbreviated Instructions for Chromatograms

D1: Sample was analyzed past the end of recommended holding time. See Sample Summary Form.
D2: Sample was reanalyzed past holding time. Initial analysis was performed within recommended holding time.
D3: Sample was reanalyzed past the end of recommended holding time.
H1: High RPD. Because the sample and duplicate results are multiple times the reporting limit, the RPD is not reported.
I: Which is elevated because of the sample matrix. Confirm with the sample results.
P: Sample results primary to analysis.

DATA QUALITY REPORT
INORGANICS

Explain any "no" responses to questions below, and any corrective actions in the comments section below.

1.	Is the method name and number correct and appropriate?	yes/no/N/A
2.	Holding times met for all analyses and for all samples?	yes/no/N/A
3.	Are definitions correct?	yes/no/N/A
4.	Is the reporting basis correct? (Dry Weight)	yes/no/N/A
5.	All quality control criteria met?	yes/no
6.	Is the calibration curve correlation coefficient ≥ 0.9991?	yes/no/N/A
7.	MBs, CCVs, CCBs, LCSs, Dups, and Spikes, analyzed at proper frequency?	yes/no/N/A
8.	Are ICVs, CCVs, and CCBs all within acceptance limits?	yes/no/N/A
9.	Are results for methods blanks all ND?	yes/no/N/A
10.	Are all QC samples within acceptance criteria? (LCS % rec, MS/DMS % rec, DUP or MS/DMS RPDs, etc.)	yes/no/N/A
11.	Are all exceptions explained?	yes/no/N/A
12.	Have all applicable service requests been reviewed?	yes/no/N/A
13.	Are all samples labeled correctly?	yes/no/N/A
14.	Were all instructions on the service request been followed? (e.g. Special MDLs, QC on a specific sample, Form V)	yes/no/N/A
15.	Are detection limits and units reported correctly?	yes/no/N/A
16.	Is the ensured space on the bench sheet crossed out?	yes/no/N/A
17.	Was analysis started in by the due date? (n-1)(If late record DRF)	yes/no/N/A

DATA QUALITY REPORT
INORGANICS

Explain any non-conformances, qualitative or analytical problems, and other comments in the comments section below.

1	Is the method name and number correct and approved?	yes no N/A
2	Holding times met for all analyses and for all samples?	yes no N/A
3	Are calculations correct?	yes no N/A
4	Is the reporting basis correct (dry wt, etc)?	yes no N/A
5	All quantitations performed?	yes no
6	Is the calibration curve with a correlation coefficient ≥ 0.995?	yes no N/A
7	MBs, LCSs, CCVs, ICSs, ICVs, and spikes analyzed at proper frequency?	yes no N/A
8	Are ICVs, CCVs and ICSs within acceptance limits?	yes no N/A
9	Are results for methods blank all ND?	yes no N/A
10	Are all QC samples within acceptance criteria? (LCS %rec, MS/MSD %rec, RPD, or MS/DMS RPD, etc.)	yes no N/A
11	Are all exceptions explained?	yes no N/A
12	Have all applicable sample results been reviewed?	yes no N/A
13	Are all samples labeled correctly?	yes no N/A
14	Have all instrument outputs been signed? (e.g. Spectral, MDL, QC, or a specific sample, form 1)	yes no N/A
15	Are detection limits and units reported correctly?	yes no N/A
16	Is the amount space on the bench sheet correct?	yes no N/A
17	Was analysis carried out by the due date? (or if not, was it allowed?)	yes no N/A

DATA QUALITY REPORT
INORGANICS

Explain any no response, questionable, or missing data in the comments section below.

1	Is the method name and number correct and appropriate?	(yes) no NA
2	Holding times met for analysis and for sample?	yes no NA
3	Are calculations correct?	(yes) no NA
4	Is the reporting basis correct (Dry Weight)?	(yes) no NA
5	Is equipment calibrated properly?	(yes) no
6	Is the calibration curve correlation coefficient > 0.995?	(yes) no NA
7	MRL (CRQL, CRDL, RL, Dupes and Spikes analyzed at proper frequency?	(yes) no NA
8	Are ICVs, CCVs and CRIs all within acceptance criteria?	(yes) no NA
9	Are results in methods blank all ND?	(yes) no NA
10	Are all spike/surrogate recoveries acceptable? (LCS, MS, DMS, SRM, MS/MSD, DUP, PDS, MS DMS, ABS, etc.)	(yes) no NA
11	Are all exceptions explained?	(yes) no NA
12	Have all analytical service requests been reviewed?	(yes) no NA
13	Are all samples analyzed correctly?	(yes) no NA
14	Have all results been in the service request? (Check for missing results, e.g. Special Wks, DC, or a specific sample, Form V)	(yes) no NA
15	Are detection limits and units reported correctly?	(yes) no NA
16	Is the raised space on the level sheet provided?	(yes) no NA
17	Was analysis performed in the appropriate Analytical Sequence?	(yes) no NA

DATA QUALITY REMINDERS
EXCEPTIONS

Explain any "no" responses in comments below and any corrective action in the comments section below.

	Is the method name and number correct and appropriate	yes no N/A
2	Holding times met for all analytes and for all samples?	yes no N/A
3	Are calculations correct?	yes no N/A
4	Is the reporting limit correct (Dry Weight)	yes no N/A
5	All quality control criteria met	yes no
6	Is the calibration curve verification within criteria?	yes no N/A
7	MBLC, CVC, CCVs, LCSs, Dups and spikes analyzed at proper frequency?	yes no N/A
8	Are MBLCs, CVCs and CCVs within acceptance limits	yes no N/A
9	Are results for methods Black and SIM?	yes no N/A
10	Are all QC samples within acceptance criteria? (LCS Tests, MS DNS Tests, DUP for MS DNS DUPs, etc.)	yes no N/A
11	Are all exceptions explained?	yes no N/A
12	Have all applicable service requests been initiated	yes no N/A
13	Are all samples labeled correctly?	yes no N/A
14	Have all formatted or the service requests been followed? (e.g. Special Wells, QC on a specific sample, Item X)	yes no N/A
15	Are calculations correct and/or is reported correctly	yes no N/A
16	Is the proper class or the level been provided?	yes no N/A
17	Was analysis conducted by the analyst designated on the request SR#?	yes no N/A

DATA QUALITY REPORT
INORGANICS

Explain any "No" responses to questions below, and any corrective actions in the comments section below.

1.	Is the method name and number correct and appropriate?	Yes/No/NA
2.	Holding times met for all analytes and for all samples?	Yes/No/NA
3.	Are calculations correct?	Yes/No/NA
4.	Is the reporting basis correct? (Dry Weight)	Yes/No/NA
5.	All quality control criteria met?	Yes/No
6.	Is the calibration curve correlation coefficient ≥ 0.9995?	Yes/No/NA
7.	MBs, CCVs, CCBs, LCSs, Dups, and Spikes, analyzed at proper frequency?	Yes/No/NA
8.	Are ICVs, CCVs, and CCBs all within acceptance limits?	Yes/No/NA
9.	Are results for methods blanks all ND?	Yes/No/NA
10.	Are all QC samples within acceptance criteria? (LCS % rec, MS/DMS % rec, DUP or MS/DMS RPDs, etc.)	Yes/No/NA
11.	Are all exceptions explained?	Yes/No/NA
12.	Have all applicable service requests been reviewed?	Yes/No/NA
13.	Are all samples labeled correctly?	Yes/No/NA
14.	Have all instructions on the service request been followed? (e.g. Special MDLs, QC on a specific sample, Form V)	Yes/No/NA
15.	Are detection limits and units reported correctly?	Yes/No/NA
16.	Is the second space on the benchsheet crossed out?	Yes/No/NA
17.	Was analysis turned in by the data due date? (If not record SRs)	Yes/No/NA

[illegible]	[illegible]	[illegible]	[illegible]
[illegible]	[illegible]	[illegible]	[illegible]

Reagents: Concentration
HCl 0.02 N

B = Phenolphthalein Alkalinity T = Total Alkalinity

Phenolphthalein alkalinity is the quantity titrated from pH 8.3 to pH 8.3

Alkalinity mg CaCO3/L = (A [illegible] N [illegible]) x 50,000/ mL sample

Alkalinity Low level mg CaCO3/L = ((2A [illegible] - B [illegible]) [illegible] N [illegible]) x 50,000/ mL sample

HG-CGC-AAS-01 Arsenic Speciation Data Review Form

Element: Total Inorganic Arsenic

Starlims Run #: 726553

CALSTD Source: AA1-42-C
CALVER Source: AA1-41-J
Pipettors ID: As 20-200, As 100-1000, As 1000-5000

Service Request Numbers: K2105450, K2105449, K2105592, K2105451, K2105579, K2105877, K2106175, K2106188

	Yes	No	NA
1) Three or more non-zero calibration points analyzed	X		
2) Mean calibration factor RSD <20%	X		
3) CALVER's within 20% of true value	X		
4) CALBLK's below MDL	X		
5) CALVER's, CALBLK's run every 10 samples	X		
6) A minimum of three method blanks analyzed	X		
7) All reported samples within calibration range	X		
8) MS/MSD every 10 samples	X		
9) MS/MSD within 50-150%, RPD <35%	X		
10) Samples analyzed within hold time	X		
11) QCS analyzed quarterly with the mean from 3 analyses within ±10% of the true value	X

HG-CGC-AAS-01 Arsenic Speciation Data Review Form

Element: As

Starting Run #: 120802

CALSTD Source: AA1-42-G
CALVER Source: AA1-41-2
Pipettes ID: As 20-200, As 100-1000, As 1000-5000

Service Request Numbers: K2105532, K2105619, K2105615, K2105681, 81-14

	Yes	No	NA
1) Three or more non-zero calibration points analyzed	X		
2) Mean calibration factor RSD <20%	X		
3) CALVERs within 30% of true value	X		
4) CALBLKs below MRL	X		
5) CALVERs, CALBLKs ran every 10 samples	X		
6) A minimum of three method blanks analyzed	X		
7) All reported samples within calibration range	X		
8) MS/MSD every 10 samples	X		
9) MS/MSD within 30-170%, RPD <35%	X		
10) Samples analyzed within hold time	X		
11) QCS analyzed quarterly with the mean from 3 analyses within 10% of true value	X

Laboratory Results for: Grumman Rd MNR

Dear Jessica,

Enclosed are the results of the sample(s) submitted to our laboratory June 04, 2021
For your reference, these analyses have been assigned our service request number **K2106466.**

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3376. You may also contact me via email at Mark.Harris@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Client: Anchor QEA, LLC
Project: Grumman Rd MNR
Sample Matrix: Water

Service Request: K2106466
Date Received: 06/04/2021

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples for the Tier II level requested by the client.

Sample Receipt:

Seventeen water samples were received for analysis at ALS Environmental on 06/04/2021. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The samples were stored at minimum in accordance with the analytical method requirements.

Metals:

No significant anomalies were noted with this analysis.

General Chemistry:

Method 300.0, 06/16/2021: The matrix spike recoveries of Sulfate for sample GR_GWC_15_002 were outside control criteria. Recovery in the Laboratory Control Sample (LCS) was acceptable, which indicated the analytical batch was in control. The matrix spike outliers suggested a potential low bias in this matrix. No further corrective action was appropriate.

Approved by Noe D. Daw Date 07/22/2021

Inorganic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated value.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.
H	The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

#	The control limit criteria is not applicable. See case narrative.
J	The result is an estimated value.
E	The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
M	The duplicate injection precision was not met.
N	The Matrix Spike sample recovery is not within control limits. See case narrative.
S	The reported value was determined by the Method of Standard Additions (MSA).
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
W	The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
+	The correlation coefficient for the MSA is less than 0.995.
Q	See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
A	A tentatively identified compound, a suspected aldol-condensation product.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
C	The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
D	The reported result is from a dilution.
E	The result is an estimated value.
J	The result is an estimated value.
N	The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
P	The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

F	The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
L	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
H	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
O	The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
Y	The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
Z	The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.
Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/anlayte is offered by that state.

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Analysis Method:	6020A		
Prep Method:	EPA CLP ILM04.0		

Matrix Spike
KQ2110918-04

Analyte Name	Sample Result	Result	Spike Amount	% Rec	% Rec Limits
Arsenic	72.4	196	125	99	75-125
Iron	3430	3370	125	-49 #	75-125
Molybdenum	113	175	62.5	100	75-125

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Matrix Spike and Matrix Spike Duplicate Data is presented for information purposes only. The matrix may or may not be relevant to samples reported in this report. The laboratory evaluates system performance based on the LCS and LCSD control limits.
