2022 Semi-Annual Groundwater Monitoring & Corrective Action Report
Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10

CERTIFICATION STATEMENT

This 2022 Semi-Annual Groundwater Monitoring & Corrective Action Report, Georgia Power Company - Plant Bowen Solid Waste Disposal Facility Landfill Cells 1 & 2, 3 & 4, and 9 & 10 has been prepared in compliance with the United States Environmental Protection Agency Coal Combustion Residual Rule [40 Code of Federal Regulations (CFR) 257 Subpart D] and the Georgia Environmental Protection Division Rules for Solid Waste Management 391-3-4-.10 by a qualified groundwater scientist or engineer with Stantec Consulting Services Inc. I hereby certify that I am a qualified groundwater scientist, in accordance with the Georgia Rules of Solid Waste Management, and 40 CFR Part 258.60(g).

Executive Summary

This summary of the 2022 Semi-Annual Groundwater Monitoring and Corrective Action Report provides the status of the groundwater monitoring and corrective action program for the period of January through July 2022 at the Georgia Power Company (Georgia Power) Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10 (the Landfill or the Site). This summary was prepared by Stantec Consulting Services Inc. (Stantec) on behalf of Georgia Power to meet the requirements listed in Part A, Section 6¹ of the United States Environmental Protection Agency (US EPA) coal combustion residuals rule (CCR Rule) (Title 40 Code of Federal Regulations [40 CFR] 257 Subpart D).

Plant Bowen solid waste disposal (landfill cells) facility is located in Bartow County off State Highway 113, approximately 7 miles west-southwest of Cartersville, Georgia and 20 miles southeast of Rome, Georgia. The disposal facility receives coal combustion by-products, coal ash and gypsum, from coal power generating processes at Plant Bowen. The landfill cells are lined in accordance with Solid Waste Permit No. 008-018D (LI). Gypsum placement in disposal Cells 1 & 2 began in November 2008, whereas ash placement in disposal Cells 3 & 4 began in February 2015. Waste placement operations were initiated in Cells 9 & 10 in November 2015 and are only used to store non-marketable gypsum. The Site is located on the northeastern portion of the Plant Bowen property.

Plant Bowen Landfill Cells

The groundwater monitoring program for the landfill is managed in accordance with the landfill's Solid Waste Permit No. 008-018D (LI), as issued by the Georgia Environmental Protection Division (GA EPD), and in accordance with Georgia Solid Waste Management Rules for Groundwater Monitoring and Corrective Action of a municipal solid waste landfill, Rule 391-3-4.14. The landfill is also subject to the US EPA CCR rule and the GA EPD Rules for Solid Waste Management 391-3-4-.10. Groundwater at the Site is monitored using a groundwater monitoring system of wells installed to meet federal and state monitoring requirements.

Groundwater monitoring, in accordance with the permit-issued Design and Operations Plan, began in 2007 prior to disposal activities, and continues to date. Routine sampling and reporting for CCR Rule

¹ 80 FR 21468, Apr. 17, 2015, as amended at 81 FR 51807, Aug. 5, 2016; 83 FR 36452, July 30, 2018; 85 FR 53561, Aug. 28, 2020

**2022 Semi-Annual Groundwater Monitoring & Corrective Action Report
Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10**

Appendix III constituents began after the background groundwater conditions were established between February 2016 and August 2017.

During the 2022 semi-annual reporting period, one groundwater sampling event was conducted in January-February 2022. Groundwater samples were submitted to Pace Analytical Services, Inc., for analysis of Appendix III parameters². Per the CCR Rule, groundwater results for the January-February 2022 event were evaluated in accordance with certified statistical methods. Verified Appendix III SSIs are provided in the table below, and are addressed by the April 19, 2018 Alternate Source Demonstration (ASD) with the exception of GWC-48 (chloride).

Appendix III Constituents (SSIs)	January-February 2022
Calcium	GWC-16R, GWC-17R, GWC-21R, GWC-23R
Chloride	GWC-48
pH (lower limit)	GWC-48

Based on review of the Appendix III statistical results completed for the groundwater monitoring and corrective action program in January through July 2022, the Site will continue in detection monitoring. An ASD will be submitted to address the SSIs (not addressed in previous ASDs). Georgia Power will continue routine groundwater monitoring and reporting at the landfill. Reports will be posted to the website and provided to GA EPD semi-annually.

² Boron, calcium, chloride, fluoride, pH, sulfate, and total dissolved solids (TDS)

1 Introduction

This 2022 Semi-Annual Groundwater Monitoring & Corrective Action Report has been prepared by Stantec Consulting Services Inc. (Stantec) on behalf of Georgia Power Company (Georgia Power) to document groundwater monitoring activities conducted from January through July 2022 at Georgia Power's Plant Bowen solid waste disposal facility Cells 1 & 2, 3 & 4, and 9 & 10 (Landfill or Site). The groundwater monitoring activities were conducted in accordance with the United States Environmental Protection Agency (US EPA) Coal Combustion Residuals (CCR) Rule 40 Code of Federal Regulations (CFR) 257 Subpart D and the Georgia Environmental Protection Division (GA EPD) Rules of Solid Waste Management 391-3-4-.10.

Groundwater monitoring is also conducted under the requirements of the Georgia Solid Waste Permit No. 008-018D (LI) and in accordance with the specifications in the Design and Operation (D&O) Plan. This includes semi-annual groundwater sampling and groundwater level monitoring at the Site. A minor modification, dated August 9, 2017, approved the addition of Appendix III and IV constituents contained in the CCR Rule to the groundwater monitoring plan in Solid Waste Permit No. 008-018D (LI). An application for a new Georgia CCR permit, dated November 20, 2018, was submitted for the facility to replace the Solid Waste Permit. The application is being revised and is pending submittal to GA EPD.

This report provides the results from one semi-annual sampling event conducted in January-February 2022 and the resampling event in April 2022 at Cells 1 & 2, Cells 3 & 4, and Cells 9 & 10. This sampling event included the scheduled semi-annual sampling for the D&O Appendix I constituents and the US EPA's CCR Appendix III constituents. The April 2022 resampling event was conducted to verify the initial statistically significant increases (SSIs) identified in the January-February 2022 semi-annual event. This report satisfies the reporting requirements of applicable GA EPD Solid Waste Management Rules (391-3-4-.14) and federal and Georgia CCR Rule 40 CFR 257.90 (e) and 391-3-4-.10. In this report, for ease of reference when discussing the CCR Rules, the US EPA CCR Rules are cited.

1.1 Site Description and Background

The Plant Bowen Landfill is a Georgia Power-owned property located in Bartow County off State Highway 113, approximately 7 miles west-southwest of Cartersville, Georgia, and 20 miles southeast of Rome, Georgia (Figure 1). The disposal facility is approximately 300 acres located on a previously undeveloped, contiguous portion of the plant property. The Plant Bowen active Landfill Cells 1 & 2, 3 & 4, and 9 & 10 are located on the northeast portion of the Plant Bowen property. The disposal facility receives coal combustion by-products, coal ash and gypsum, from coal power generating processes at Plant Bowen. The landfill cells are lined in accordance with Solid Waste Permit No. 008-018D (LI). Cells 3 & 4 have a leachate collection system. Gypsum placement in disposal Cells 1 & 2 began in November 2008, whereas ash placement in disposal Cells 3 & 4 began in February 2015. Waste placement operations were initiated in Cells 9 & 10 in November 2015. Cells 9 & 10 are only used to store non-marketable gypsum. Cells 5, 6, 7, and 8 are undeveloped at this time and may be used as future cells.

**2022 Semi-Annual Groundwater Monitoring & Corrective Action Report
Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10
1 Introduction**

A groundwater monitoring system around each of the active disposal cells monitors the groundwater conditions at the Site. The monitoring well locations are shown on Figure 2. A subset of the monitoring wells is equipped with data loggers and telemetry systems for water level measurements and data transmission for real-time monitoring of groundwater levels in the subsurface karst geology.

Groundwater monitoring began in 2007 in accordance with the D&O Plan, prior to disposal activities and continues to date. Groundwater monitoring and reporting activities, conducted in accordance with § 257.90 through § 257.94 of the federal CCR Rule, were initiated in 2016. Pursuant to § 257.94(b), the eight baseline sampling events were conducted February 2016 to August 2017, with the initial detection monitoring event occurring in September-October 2017.

1.2 Regional Geology and Hydrogeologic Setting

The regional geology and hydrogeology of the Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10 area are summarized below. The Site lies within the Valley and Ridge physiographic province about three to four miles north of the Cartersville Fault. The Cartersville Fault separates the late Precambrian-aged metamorphic rocks to the east and south from the Cambrian-aged sedimentary rocks to the north-northwest and west.

As described in the Hydrogeologic Report and Groundwater Monitoring Plan (Southern Company Services [SCS] 2006), the lithologies present in the landfill area of Plant Bowen from the ground surface to depth are terrace deposits, a residuum clay overburden, dolomite, and limestone bedrock. The Knox Group (dolomite and limestone bedrock) produces a characteristic orange to red clayey residuum (overburden) that ranges in thickness from 19 to 127 feet across the Site and often contains weathered chert and dolomite fragments. Silt and clay with some gravel and sand (terrace deposits) overlay the clayey residuum in some areas but are not continuous across the landfill area of Plant Bowen.

Two main hydrostratigraphic layers (water-bearing zones) are present at the Site: overburden (residuum clay), and bedrock (dolomite and limestone) – both units comprise the uppermost aquifer for groundwater monitoring purposes. The uppermost aquifer is unconfined. Overburden materials are heterogeneous ranging in composition from well-graded gravelly sand to fat clay. Bedrock underlying the Site (officially mapped as Knox undifferentiated) is a carbonate bedrock. Karst features within the underlying carbonate bedrock are predominately formed along initial discontinuities including joints, fissures (slots), fractures, and bedding planes or other linear features. These karst features may be partially or completely filled with soft unconsolidated sediments or may be empty or filled with water. The top of the karst features is usually identified as having a thin zone of weathered carbonate bedrock.

The water table commonly occurs in the lower overburden, but at some locations the water table is near the overburden-bedrock interface or in the upper fractured bedrock. Based on these data, it is assumed that the overburden and upper fractured bedrock are a single inter-connected water-bearing zone below the unsaturated overburden. Therefore, the saturated overburden and the upper fractured sedimentary bedrock together comprise the uppermost aquifer beneath the landfill area at Plant Bowen.

**2022 Semi-Annual Groundwater Monitoring & Corrective Action Report
Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10
1 Introduction**

The groundwater flow in the Landfill Cells 1 & 2, 9 & 10 area is generally to the north-northeast and west-northwest in the Landfill Cells 3 & 4 area. However, there are variations in groundwater flow direction due to heterogeneous and anisotropic conditions at the Site.

1.3 Groundwater Monitoring System

The existing groundwater monitoring system meets the requirements listed in § 257.91 and 391-3-4.14; a groundwater monitoring system was installed at the Landfill that consists of a sufficient number of wells installed at appropriate locations and depths to yield groundwater samples from the uppermost aquifer to represent the groundwater quality both upgradient of the unit (i.e., background conditions) and passing the waste boundary of the unit. The number, spacing, and depths of the groundwater monitoring wells were selected based on the characterization of site-specific hydrogeologic conditions. Pursuant to 40 CFR § 257.91, the groundwater monitoring system was certified by a professional engineer on October 17, 2017; the certification is maintained in the Site's operating records. The locations of the compliance wells included in the groundwater monitoring system are presented on Figure 2. Well construction details are listed in Table 1.

2 Groundwater Monitoring Activities

The following describes monitoring-related activities performed from January to July 2022. Samples were collected in January-February 2022 from each of the wells in the groundwater monitoring system shown on Figure 2. Table 2 presents a summary of the 2022 groundwater sampling events completed for the Landfill during this monitoring period.

2.1 Monitoring Well Installation and Maintenance

Monitoring wells are inspected semi-annually to determine if repairs or corrective actions are necessary to meet the requirements of the Georgia Water Well Standards Act (O.C.G.A. § 12-5-134(5)(d)(vii)). In January-February 2022, monitoring wells were inspected, and necessary corrective actions were identified and subsequently completed, as documented in Appendix A.

The following modifications were made to the groundwater monitoring system during the 2022 reporting period:

- Georgia Power abandoned GWA-36 on March 15, 2022, due to persistent high turbidity during the January-February 2022 semi-annual groundwater sampling event, which identified possible filter pack sand in the pump used for purging and sampling of the well. The well was replaced with GWA-36A, which was located less than 50 feet from GWA-36. The well screen of GWA-36A was placed to intercept a water-bearing zone in the overburden similar to GWA-36.
- Georgia Power abandoned GWA-4 on March 14, 2022 without replacement due to the lack of continuous and persistent groundwater present in the overburden at that location.
- The Well Installation Report for GWA-36A and Abandonment Report for GWA-4 and GWA-36 were submitted on May 6, 2022 to GA EPD and are provided in Appendix B.

2.2 Detection Monitoring Program

Georgia Power currently monitors groundwater associated with the landfill under the detection groundwater monitoring program in accordance with § 257.94 and Solid Waste Management Rule 391-3-4-.14(22). The semi-annual detection monitoring event occurred in January-February 2022. Groundwater samples were collected from monitoring wells in the groundwater monitoring system (Figure 2) and analyzed for:

- Appendix III constituents according to § 257.94(a);
- A state-modified Appendix I list of detection constituents according to GA EPD Rules for Solid Waste Management 391-3-4-.14 and the approved D&O plan. The state-modified analyte list (D&O Appendix I Metals) includes antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc; and

**2022 Semi-Annual Groundwater Monitoring & Corrective Action Report
Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10
2 Groundwater Monitoring Activities**

- Field parameters recorded during sampling including pH, temperature, turbidity, dissolved oxygen (DO), specific conductance, and oxidation-reduction potential (ORP).

2.3 Additional Sampling

An ephemeral spring at the Site, as shown on Figure 2, is checked for water during each groundwater sampling event. Water was not present in the spring during the January-February 2022 event and was not sampled.

In addition to routine Appendix I D&O and Appendix III constituents, groundwater samples from the January-February 2022 event were analyzed for major cations and anions. The chemical composition of groundwater based on major ion chemistry data will be used to evaluate groundwater quality. Results are included in laboratory reports discussed in Section 3.5.

3 Sample Methodology & Analyses

The following section presents a summary of the field sampling procedures that were implemented, and the groundwater sampling results that were obtained in connection with the detection monitoring program conducted January through July 2022.

3.1 Groundwater Elevation Measurements and Flow Direction

Prior to each sampling event, groundwater levels were recorded at each monitoring well and piezometer at the Landfill. The calculated groundwater elevations for the January-February 2022 sampling event are presented in Table 3.

The groundwater elevation data were used to develop potentiometric surface elevation contour maps (Figure 3 and 4). Review of Figures 3 and 4 shows that groundwater elevations vary between landfill cells due to topographic variations in the overburden-bedrock aquifer. Groundwater elevations are similar between the overburden and the upper bedrock at most onsite locations indicating hydraulic communication between the saturated overburden and upper bedrock. The general direction of groundwater flow in the overburden and bedrock of Landfill Cells 1 & 2 and 9 & 10 area is to the north-northeast, and to the west-northwest for Landfill Cells 3 & 4. Observed groundwater elevations and flow directions are consistent with previous observations.

3.2 Groundwater Gradient and Flow Velocity

The groundwater flow velocity at the Site was calculated using a derivation of Darcy's Law. Specifically,

$$V = \frac{K \cdot i}{n_e}$$

Where:

V = Groundwater flow velocity $\left(\frac{\text{feet}}{\text{day}}\right)$

K = Average horizontal hydraulic conductivity of the aquifer $\left(\frac{\text{feet}}{\text{day}}\right)$

i = Horizontal hydraulic gradient $\left(\frac{\text{feet}}{\text{foot}}\right)$

n_e = Effective porosity

The general groundwater flow velocity for the Site is based on hydraulic gradients, average hydraulic conductivity based on previous slug test data, and an estimated effective porosity of 0.01 (based on default soil type value for silty clays to clays in US EPA 530/SW-89-031 [US EPA 1989]) for the screened horizon. The average hydraulic conductivity (measured in centimeters/second or cm/sec) values used in the soil aquifer calculations (2.54×10^{-5} cm/sec = 0.072 feet per day [ft/day]) and the bedrock aquifer calculations (1.26×10^{-4} cm/sec = 0.36 ft/day) are presented in the Plant Bowen Proposed Coal Combustion By-Product Storage Facility Site Acceptability Report (SCS, 2002). The general groundwater flow velocity calculation is presented in Table 4. Results for groundwater flow

**2022 Semi-Annual Groundwater Monitoring & Corrective Action Report
Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10
3 Sample Methodology & Analyses**

velocities range from approximately 0.02 to 0.15 ft/day in the overburden aquifer and from approximately 0.02 to 0.29 ft/day in the bedrock aquifer, based on the range of calculated flow velocities presented in Table 4.

Lower groundwater velocities noted in the overburden material are due to the abundance of residual clays in this zone. Higher velocities noted in the upper fractured bedrock are attributed to preferential groundwater flow in the fractured bedrock. Groundwater flow in the Knox Dolomite Formation, underlying the Site, occurs in joints, fractures, bedding planes, and solution channels (Croft, 1963). These pathways can facilitate relatively higher groundwater flows in the upper fractured bedrock. However, the flow rates noted in the wells screened in the upper fractured bedrock (Table 4) also suggest an abundance of residual clays in the zone where the top of the carbonate bedrock is more weathered than the underlying karst features at the Site.

3.3 Continuous Water Level Monitoring (Hydrogeologic Monitoring)

Georgia Power continuously monitors groundwater level fluctuations in accordance with the Plant Bowen Site Acceptability Report - Hydrogeological Assessment and Demonstration of Engineering Measures (SCS, 2004). The hydrogeologic monitoring network provides site-wide water-level data, which are evaluated for changes in subsurface hydrologic conditions. The hydrogeologic data are evaluated weekly and reported semi-annually.

3.3.1 HYDROGEOLOGIC MONITORING NETWORK

Hydrogeologic monitoring locations shown on Figure 2 for Cells 1 & 2, 3 & 4, and 9 & 10 were selected following analysis of the interim data and review of historical groundwater elevations and potentiometric surface maps. Across the landfill cells, there are a total of 37 wells as of January 2022 currently equipped with transducers for monitoring water levels.

For the hydrogeologic monitoring network, Georgia Power utilized In-Situ® Instruments, Inc.'s Win-Situ® reporting software, and Level Troll 500® pressure transducers. Each pressure transducer was deployed in a selected monitoring well at a fixed depth and linked to its own telemetry box with a vented transducer cable. Groundwater levels were recorded multiple times daily from each well transducer, and each transducer was programmed to record fluctuations in water levels of ± 0.5 feet occurring within 4-hour recording schedules. The telemetry system relays water level data via satellite to a central data storage unit that can be accessed in real-time over the internet; whereby, the data can be checked for anomalous groundwater level fluctuations. Groundwater elevations, along with the river stage elevations and rainfall data, recorded between December 16, 2021, and June 3, 2022 are provided in two monitoring reports for the three disposal cell units as Appendix C: Memoranda on Hydrogeologic Monitoring Program.

Monitoring well GWA-36 was abandoned on March 16, 2022 and replaced with new monitoring well GWA-36A on March 18, 2022. A new transducer has not been installed in replacement well GWA-36A. During this reporting period, the data for the transducer location at GWA-36 are not continuous because this transducer was offline due to drilling activities. During the past six-month period, transducers from wells GWA-3A, GWC-25R, and GWC-49R were inspected to troubleshoot the telemetry systems. SCS

**2022 Semi-Annual Groundwater Monitoring & Corrective Action Report
Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10
3 Sample Methodology & Analyses**

staff have identified the potential issues associated with GWC-25R and GWC-49R and are working on correcting these in time for the upcoming hydrogeological monitoring period. The ongoing data upload issues associated with GWA-3A have yet to be resolved and are being investigated.

The United States Geological Survey (USGS) river gauge (#02394670) at Cartersville, Georgia was used to monitor the surface water elevations in the Etowah River. Rainfall data are also obtained from the USGS station #02394670 on the Etowah River at Georgia Route 61 and from an on-site rain gauge.

3.3.2 HYDROGEOLOGIC MONITORING RESULTS

The hydrogeologic monitoring network pressure transducers are operational and collecting continuous groundwater elevation data, with the exceptions described in Appendix C. Tables in the hydrogeologic monitoring memoranda (Appendix C) list identified data anomalies and the causes during the monitoring period. Observed disruptions in the transducer water levels were found to be directly attributed to: (a) drawdown during sampling events, water level gauging, and well development, (b) maintenance of wells, transducers, or telemetry units, or (c) significant rainfall events (greater than 1.5 inches of rain). The December 16, 2021, through June 3, 2022, hydrologic monitoring data did not show water level fluctuations or sudden decreases in groundwater elevation data attributed to subsurface changes that might be indicative of land subsidence or sinkhole formation.

3.4 Groundwater Sampling

Groundwater samples were collected for the January-February 2022 monitoring event. Sampling procedures were conducted in accordance with US EPA Region 4 Laboratory Services and Applied Science Division operating procedures (US EPA 2013, 2017). Monitoring wells were purged and sampled using low-flow sampling procedures. Dedicated or non-dedicated low-flow pneumatic bladder pumps were used to purge and sample the wells. A SmartTroll® or AquaTroll® (In-Situ field instrument) was used to monitor and record field water quality parameters (pH, conductivity, DO, temperature, and ORP) and a Hach 2100Q was used to measure turbidity during well purging to verify stabilization prior to sampling.

Groundwater samples were collected when the following stabilization criteria were met for three consecutive readings:

- pH \pm 0.1 Standard Units
- Specific conductance \pm 5%
- \pm 10% for DO where DO > 0.5 milligrams per liter (mg/L). No criterion applies if DO < 0.5 mg/L.
- Turbidity measurements less than 5 Nephelometric Turbidity Units (NTUs), or between 5 and 10 NTUs after 3 hours of purging.
- Temperature – Record only, not used for stabilization criteria.
- ORP – Record only, not used for stabilization criteria.

**2022 Semi-Annual Groundwater Monitoring & Corrective Action Report
Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10
3 Sample Methodology & Analyses**

Once stabilization was achieved, samples were collected into appropriately preserved laboratory-supplied sample containers. Sample bottles were placed in ice-packed coolers and submitted to Pace® Analytical Services (Pace) in Peachtree Corners (Atlanta), Georgia following standard chain-of-custody protocol. Stabilization logs and Equipment Calibration forms are included in Appendix D.

3.5 Laboratory Analyses

Laboratory analyses were performed by Pace, of Peachtree Corners (Atlanta), Georgia. Pace is accredited by National Environmental Laboratory Accreditation Program (NELAP) and maintains a NELAP certification for the constituents analyzed. In addition, Pace are certified to perform analysis by the State of Georgia. Groundwater data laboratory reports and chain-of-custody records for the monitoring events are presented in Appendix D.

The groundwater analytical results from the January-February 2022 detection event and the April 2022 verification event are summarized in Tables 5 through 7. The Pace laboratory reports associated with these results are provided in Appendix D. The pH field measurements recorded during the detection monitoring and verification sampling events are also provided in Tables 5 through 7.

3.6 Quality Assurance & Quality Control

During each sampling event, quality assurance/quality control (QA/QC) samples were collected. Equipment blanks (where non-dedicated sampling equipment is used) were collected at a rate of one QA/QC sample per 10 groundwater samples. Blind field duplicate samples were collected by filling additional containers at the same location during the sampling event at a rate of one QA/QC sample per 10 groundwater samples. Field blanks were also collected to evaluate ambient conditions at the sampling locations at a rate of one QA/QC sample per 10 groundwater samples.

QA/QC of the groundwater data were assessed by performing a data quality evaluation of the reported laboratory results. A data quality evaluation was conducted on the data using laboratory precision and accuracy, and analytical method requirements (US EPA, 2002). The data quality evaluations are included in Appendix D.

The analytical results provided in Table 5 provide concentrations from the January-February 2022 groundwater sampling event and the April 2022 verification event as reported by the laboratory. When values are followed by a "J" flag, this indicates that the value is an estimated analyte concentration detected between the method detection limit and the laboratory reporting limit. The estimated value is positively identified but is below the lowest level that can be reliably achieved within specified limits of precision and accuracy under routine laboratory operating conditions. Radium values followed by a "U" flag indicate that the constituent was not detected above the analytical minimum detectable concentration. The data are considered usable for meeting project objectives and the results are considered valid.

4 Statistical Analysis

This section presents a summary of the statistical approach applied to assess the 2022 semi-annual groundwater data for potential SSIs of permit stipulated constituents reported in downgradient compliance wells relative to the available historical dataset. The statistical analyses used at the Site for Appendix I D&O and CCR Rule Appendix III constituents were conducted pursuant to § 257.93 and Rule 391-3-4-.14 in accordance with the recommended statistical methodology provided in 2017 MacStat Consulting, Ltd. and based on methodology presented in Statistical Analysis of Groundwater Data at RCRA Facilities, Unified Guidance, March 2009, EPA 530/R-09-007 (US EPA, 2009).

In August 2019, Georgia Power submitted a minor permit modification to GA EPD to allow for the inclusion of intrawell methods for Appendix I D&O constituents. A trend test was recommended to evaluate the naturally occurring barium concentrations in well GWC-13RZ. On February 26, 2021, Georgia Power submitted a minor modification to implement a two-step statistical approach for the detection monitoring program to address initial SSIs over background for constituents currently analyzed using an intrawell statistical approach. This approach was approved by GA EPD in a letter dated April 19, 2021. The two-step analysis is similar in concept to the procedure used in compliance monitoring programs where an interwell statistical limit is used to determine “background” (Unified Guidance, Chapter 7, Section 7.5).

On February 25, 2022, Georgia Power updated the Statistical Analysis Method Certification (certified by a registered PE) to combine Cells 1&2 and Cells 9&10 overburden and bedrock wells because both units comprise the uppermost aquifer for groundwater monitoring purposes.

4.1 Statistical Methods

Descriptions of the statistical analyses of groundwater quality data obtained in the GSC Statistical Analysis Reports are provided in Appendix E. Table 8 provides a summary of the statistical methodology used at Cells 1 & 2, 3 & 4, and 9 & 10 for the January-February 2022 event. Sanitas™ groundwater statistical software was used to perform the statistical analyses. Sanitas™ is a commercially available decision support software package that incorporates the statistical tests required of Subtitle C and D facilities by US EPA regulations and guidance as recommended in the Unified Guidance (US EPA, 2009) document. Detailed statistical methods used for Appendix I D&O and Appendix III constituents are discussed in statistical analysis packages provided in Appendix E and summarized in Section 4.1.1.

4.1.1 APPENDIX I AND APPENDIX III STATISTICAL METHOD

Intrawell and interwell methods were used to analyze the January-February 2022 and April 2022 resampling groundwater monitoring event results, as summarized in Table 8. Eligibility for intrawell methods is discussed in detail in the Statistical Analysis Reports (Appendix E). In instances where a potential SSI was identified by intrawell statistical methods, interwell statistical methods were used as a second step to determine if the initial exceedance was below a sitewide background limit. If the concentrations exceeded both the intrawell and interwell prediction limits, then an additional re-sample

**2022 Semi-Annual Groundwater Monitoring & Corrective Action Report
 Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10
 4 Statistical Analysis**

(i.e., 1 of 2 resampling) may be collected to verify the potential SSI. When a re-sample result does not exceed the intrawell prediction limit, then the result is not declared an SSI. If the resample exceeds the prediction limit or a resample is not collected, the SSI is verified and declared. In instances where a potential SSI was identified by interwell statistical methods, a re-sample may be collected to verify the initial result. When a re-sample result does not exceed the prediction limit, then the result is not declared an SSI. If the resample exceeds the prediction limit or a resample is not collected, the SSI is verified and declared.

Background data are tested using the Sen's Slope/Mann Kendall or linear regression trend test to confirm suspected increasing or decreasing trends (Appendix E). The distribution of the data determines which trend test is used.

4.2 Statistical Analyses Results

Statistical analysis of the January-February 2022 detection monitoring event Appendix III and Appendix I D&O constituent data is provided in Appendix E. The January-February 2022 and April 2022 groundwater data were statistically analyzed by GSC.

Using the intrawell and interwell and 1 of 2 resampling approach described in Section 4.1.1 for the January-February 2022 data and April 2022 verification data, five well constituent pair exceedances were identified for Cells 3 & 4 and four exceedances were identified for Cells 1 & 2 and 9 & 10. Summaries of the statistical results showing downgradient prediction limit exceedances by landfill cells are provided below for Appendix III CCR constituents (Table 9) and the Appendix I D&O constituents (Table 10).

**Not an SSI due to previous August 30, 2017 ASD

5 Alternate Source Demonstration

Alternate Source Demonstrations (ASDs) were previously submitted to GA EPD under separate report covers to address SSIs of Appendix I D&O and Appendix III constituents. Based on GA EPD guidance, ASDs no longer require concurrence if an SSI has not been detected for two consecutive events, which indicates natural variability. SSIs confirmed during this reporting period and previous event (July-August 2021) are addressed by previous ASDs listed below. SSIs from the previous event not confirmed during this reporting period are noted in the table.

Alternate Source Demonstration	Constituent	Well	Status of Approval by GA EPD
Amec Foster Wheeler Environment & Infrastructure, Inc., Alternate Source Demonstration Plant Bowen Cells 3 & 4 Solid Waste Disposal Facility Permit No. 008-018D (LI), August 30, 2017	Antimony	GWC-16R	Submitted
Wood Environment & Infrastructure Solutions, Inc., Alternate Source Demonstration Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10 Solid Waste Disposal Facility Permit No. 008-018D (LI), April 19, 2018	pH	GWC-44 ⁽¹⁾ , GWC-45 ⁽¹⁾ , GWC-48, GWC-49Z ⁽¹⁾	Approved 1/30/2019
	Barium	GWC-13RZ ⁽¹⁾	
	Calcium	GWC-16R, GWC-17R, GWC-21R, GWC-23R	
	Chloride	GWC-13RZ ⁽¹⁾	
	Zinc	GWC-47 ⁽¹⁾	
Wood Environment & Infrastructure Solutions, Inc., Alternate Source Demonstration for March 2020 Semi-Annual Event Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10 Solid Waste Disposal Facility, Permit No. 008-018D (LI) August 31, 2020	pH	GWC-9 ⁽¹⁾ , GWC-49R ⁽¹⁾	Submitted
	Zinc	GWC-47R ⁽¹⁾

 5 Alternate Source Demonstration**

Alternate Source Demonstration	Constituent	Well	Status of Approval by GA EPD
Wood Environment & Infrastructure Solutions, Inc., Alternate Source Demonstration for Barium, Chromium, and Sulfate, February-March 2021	Barium	GWC-48 ⁽¹⁾	Submitted
	Chromium	GWC-46R ⁽¹⁾	

Note:

¹ SSI from the previous event not confirmed during this reporting period.

6 Monitoring Program Status

Groundwater monitoring for the Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10 is in the detection monitoring phase. In January-February 2022, the first semi-annual monitoring event was conducted, and exceedances of statistical prediction limits were identified. Statistical exceedances of one Appendix III (chloride in GWC-48) and two Appendix I D&O constituents (beryllium in GWC-5, and mercury in GWC-48) were verified with resampling in April 2022, each detected below their respective maximum contaminant levels (MCLs). The remaining statistical exceedances were either addressed by the resampling results not verifying exceedances from the initial event or previously addressed in the ASDs. An ASD will be submitted by November 29, 2022 to address the verified SSIs not previously addressed. Groundwater monitoring at Plant Bowen Landfill Cells 1 & 2, 3 & 4, 9 & 10 will continue in the detection monitoring phase.

7 Conclusions & Future Actions

This 2022 Semi-Annual Groundwater Monitoring & Corrective Action Report for Georgia Power's Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10 was prepared to fulfill the requirements of both applicable federal and state CCR Rules and GA EPD Solid Waste Management Rules (40 CFR § 257.90(e), 391-3-4-.10, and 391-3-4-.14). In January-February 2022, verified statistical exceedances of one Appendix III and two Appendix I D&O constituents that had not been addressed by a previous ASD (chloride in GWC-48; beryllium in GWC-5, and mercury in GWC-48) were identified. No statistical exceedances were above a primary or secondary MCL. The remaining statistical exceedances were either addressed by resampling results not verifying the initial exceedance or in previous ASDs. These statistical exceedances identified during the 2022 reporting period are not thought to be the result of a release from the Landfill Cells 1 & 2, 3 & 4, and 9 & 10 and are attributed to natural variability of groundwater chemistry underlying the Site. An ASD will be submitted to address the SSIs not previously addressed in the ASDs by November 29, 2022. Pursuant to 40 CFR § 257.94(e) and § 391-3-4.14.23(c), Georgia Power will continue detection monitoring at the Site. The next scheduled 2022 semi-annual groundwater monitoring event is scheduled for August-September 2022.

Notes:

- (1) NAD83 indicates elevation in feet (ft) referenced to the North American Datum of 1983. Coordinates are from March 2021 re-survey of the Landfill wells by Donaldson & Garret Associates, Inc.
- (2) NAVD88 indicates elevation in ft referenced to the North American Vertical Datum 1988. Elevations are from March 2021 re-survey of the Landfill wells by Donaldson & Garret Associates, Inc.
- (3) Screen elevations calculated using depth below ground surface and ground surface elevations from the March 2021 re-survey.
- (4) Monitoring wells are measured for water levels and sampled for groundwater quality.
- (5) Water level piezometer measured for water level only.
- (6) Total well depth provided on well construction logs.
- (7) GWA-4 was abandoned on 3/14/2022 without replacement due to lack of continuous and persistent groundwater present in the overburden.
- (8) GWA-36 was abandoned on 3/16/2022 and was replaced with new well GWA-36A, completed on 3/18/2022 with installation of protective cover and pad.

Notes:

The average hydraulic conductivity values, measured in centimeters/second (cm/sec) used in the soil aquifer calculations (2.54 x 10⁻⁵ cm/sec = 0.072 ft/day) and the bedrock aquifer calculations (1.26 x 10⁻⁴ cm/sec = 0.36 ft/day) are presented in the 2002 Plant Bowen Proposed Coal Combustion By-Product Storage Facility Site Acceptability Report. An estimated effective porosity of 0.01 (based on default soil type value for silty clays to clays in USEPA 530/SW-89-031) of the screened horizon.

Notes:

1. Results for constituents are reported in milligrams per liter (mg/L). pH reported in standard units (s.u.).
2. < indicates the constituent was not detected above the analytical method detection limit (MDL) shown.
3. J indicates the constituent was detected at such low levels that the precision of the laboratory instruments could not produce a reliable value. Therefore, the value displayed (value J) is qualified by the laboratory as an estimated number.
4. Bolded cells indicate concentration above maximum contaminant level.
5. Appendix III - indicator parameters evaluated during Detection Monitoring
6. NA indicates constituent was not analyzed.

Notes:

1. Results for constituents are reported in milligrams per liter (mg/L). pH reported in standard units (s.u.).
2. < indicates the constituent was not detected above the analytical method detection limit (MDL) shown.
3. J indicates the constituent was detected at such low levels that the precision of the laboratory instruments could not produce a reliable value. Therefore, the value displayed (value J) is qualified by the laboratory as an estimated number.
4. Bolded cells indicate concentration above maximum contaminant level.
5. Appendix III - indicator parameters evaluated during Detection Monitoring

**TABLE 8
STATISTICAL METHOD SUMMARY**

Statistical Methodology	Data Screening on Proposed Background	Evaluate outliers, trends, and seasonality when sufficient data are available
	Statistical Limits	Interwell statistical limits are applied on a parameter basis, depending on the appropriateness of the method as determined by the Analysis of Variance. Intrawell statistical limits are applied on a parameter basis, depending on the appropriateness of the method.
	Prediction Limits	When data contain between 15-50% non-detects the Kaplan-Meier non-detect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit. Non-parametric means data sets contain greater than 50% non-detects or data are not normally or transformed-normally distributed.
	Management of Non-Detects	When data contain less than 15% non-detects in background, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the practical quantitation limit (PQL) as reported by the laboratory. When data contain between 15-50% non-detects the Kaplan-Meier non-detect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
	Confidence Intervals	Used in Assessment and Corrective Action monitoring.
	No Statistical Testing	Statistical testing is not required for parameters containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
	Verification Resample Plan	Optional 1-of-2 with minimum of 8 samples per well for interwell testing. Optional 1-of-3 or 1-of-2 with minimum of 8 samples per well for intrawell testing.
	Statistical Methodology	Optional

Title: **Potentiometric Surface - Bedrock Wells January 2022**

APPENDIX A WELL INSPECTIONS

MEMORANDUM

Date: June 21, 2022
To: Kristen Jurinko – Georgia Power
CC: Ben Hodges
From: Resolute Environmental
Subject: Plant Bowen Landfill - Well Maintenance and Repair Documentation
Georgia Power Company

Resolute Environmental has prepared this memorandum to provide documentation of groundwater monitoring well maintenance and/or repair performed at PLANT BOWEN during the semiannual reporting period. All repairs and maintenance were completed in accordance with the Georgia Environmental Protection Division (GAEPD) guidance on routine visual inspections of groundwater monitoring wells.

Georgia Power Site/Unit	Date Performed	Well ID	Maintenance/ Repair Performed
Plant Bowen Landfill	1/27/2022	GWC-18	Installed Dedicated Pump
Plant Bowen Landfill	3/22/2022	GWA-36A	Develop Well
Plant Bowen Landfill	4/5/2022	GWC-36A	Installed Dedicated Pump
Plant Bowen Landfill	4/6/2022	GWA-36A	Updated signage with sticker

All maintenance and repairs are also documented in the 2022 annual/semiannual groundwater monitoring report.

WELL MAINTENANCE AND REPAIR SUMMARY

Photo #1: Dedicated pump Installed

Photo #2: Overall condition of well

WELL MAINTENANCE AND REPAIR SUMMARY

Photo #3: "A" sticker added to former GWA-36 sign

		yes	no	n/a
1	<u>Location/Identification</u>			
a	Is the well visible and accessible?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the well properly identified with the correct well ID?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Is the well in a high traffic area and does the well require protection from traffic?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d	Is the drainage around the well acceptable? (no standing water, nor is well located in obvious drainage flow path)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2	<u>Protective Casing</u>			
a	Is the protective casing free from apparent damage and able to be secured?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the casing free of degradation or deterioration?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Does the casing have a functioning weep hole?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d	Is the annular space between casings clear of debris and water, or filled with pea gravel/sand?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e	Is the well locked and is the lock in good condition?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3	<u>Surface pad</u>			
a	Is the well pad in good condition (not cracked or broken)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the well pad sloped away from the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Is the well pad in complete contact with the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d	Is the well pad in complete contact with the ground surface and stable? (not undermined by erosion, animal burrows, and does not move when stepped on)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e	Is the pad surface clean (not covered with sediment or debris)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4	<u>Internal casing</u>			
a	Does the cap prevent entry of foreign material into the well?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the casing free of kinks or bends, or any obstructions from foreign objects (such as bailers)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Is the well properly vented for equilibration of air pressure?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d	Is the survey point clearly marked on the inner casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e	Is the depth of the well consistent with the original well log?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f	Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5	<u>Sampling: Groundwater Wells Only</u>			
a	Does well recharge adequately when purged?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater plan for the facility?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Does the well require redevelopment (low flow, turbid)?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
6	Based on your professional judgement, is the well construction / location appropriate to 1) achieve the objectives of the Groundwater Monitoring Program and 2) comply with the applicable regulatory requirements?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

1 Location/Identification				
a	Is the well visible and accessible?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the well properly identified with the correct well ID?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Is the well in a high traffic area and does the well require protection from traffic?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d	Is the drainage around the well acceptable? (no standing water, nor is well located in obvious drainage flow path)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2 Protective Casing				
a	Is the protective casing free from apparent damage and able to be secured?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the casing free of degradation or deterioration?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Does the casing have a functioning weep hole?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d	Is the annular space between casings clear of debris and water, or filled with pea gravel/sand?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e	Is the well locked and is the lock in good condition?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3 Surface pad				
a	Is the well pad in good condition (not cracked or broken)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the well pad sloped away from the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Is the well pad in complete contact with the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d	Is the well pad in complete contact with the ground surface and stable? (not undermined by erosion, animal burrows, and does not move when stepped on)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e	Is the pad surface clean (not covered with sediment or debris)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4 Internal casing				
a	Does the cap prevent entry of foreign material into the well?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the casing free of kinks or bends, or any obstructions from foreign objects (such as bailers)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Is the well properly vented for equilibration of air pressure?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d	Is the survey point clearly marked on the inner casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e	Is the depth of the well consistent with the original well log?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f	Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5 Sampling: Groundwater Wells Only				
a	Does well recharge adequately when purged?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater plan for the facility?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Does the well require redevelopment (low flow, turbid)?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
6	Based on your professional judgement, is the well construction / location appropriate to 1) achieve the objectives of the Groundwater Monitoring Program and 2) comply with the applicable regulatory requirements?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

b	Is the well properly identified with the correct well ID?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Is the well in a high traffic area and does the well require protection from traffic?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d	Is the drainage around the well acceptable? (no standing water, nor is well located in obvious drainage flow path)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2	<u>Protective Casing</u>			
a	Is the protective casing free from apparent damage and able to be secured?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the casing free of degradation or deterioration?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Does the casing have a functioning weep hole?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d	Is the annular space between casings clear of debris and water, or filled with pea gravel/sand?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e	Is the well locked and is the lock in good condition?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3	<u>Surface pad</u>			
a	Is the well pad in good condition (not cracked or broken)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the well pad sloped away from the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Is the well pad in complete contact with the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d	Is the well pad in complete contact with the ground surface and stable? (not undermined by erosion, animal burrows, and does not move when stepped on)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e	Is the pad surface clean (not covered with sediment or debris)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4	<u>Internal casing</u>			
a	Does the cap prevent entry of foreign material into the well?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the casing free of kinks or bends, or any obstructions from foreign objects (such as bailers)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Is the well properly vented for equilibration of air pressure?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d	Is the survey point clearly marked on the inner casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e	Is the depth of the well consistent with the original well log?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f	Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5	<u>Sampling: Groundwater Wells Only:</u>			
a	Does well recharge adequately when purged?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater plan for the facility?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Does the well require redevelopment (low flow, turbid)?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
6	Based on your professional judgement, is the well construction / location appropriate to 1) achieve the objectives of the Groundwater Monitoring Program and 2) comply with the applicable regulatory requirements?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

1	<u>Location/Identification</u>			
a	Is the well visible and accessible?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the well properly identified with the correct well ID?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Is the well in a high traffic area and does the well require protection from traffic?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d	Is the drainage around the well acceptable? (no standing water, nor is well located in obvious drainage flow path)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2	<u>Protective Casing</u>			
a	Is the protective casing free from apparent damage and able to be secured?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the casing free of degradation or deterioration?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Does the casing have a functioning weep hole?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d	Is the annular space between casings clear of debris and water, or filled with pea gravel/sand?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e	Is the well locked and is the lock in good condition?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3	<u>Surface pad</u>			
a	Is the well pad in good condition (not cracked or broken)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the well pad sloped away from the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Is the well pad in complete contact with the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d	Is the well pad in complete contact with the ground surface and stable? (not undermined by erosion, animal burrows, and does not move when stepped on)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e	Is the pad surface clean (not covered with sediment or debris)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4	<u>Internal casing</u>			
a	Does the cap prevent entry of foreign material into the well?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the casing free of kinks or bends, or any obstructions from foreign objects (such as bailers)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Is the well properly vented for equilibration of air pressure?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d	Is the survey point clearly marked on the inner casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e	Is the depth of the well consistent with the original well log?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f	Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5	<u>Sampling: Groundwater Wells Only</u>			
a	Does well recharge adequately when purged?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater plan for the facility?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Does the well require redevelopment (low flow, turbid)?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
6	Based on your professional judgement, is the well construction / location appropriate to 1) achieve the objectives of the Groundwater Monitoring Program and 2) comply with the applicable regulatory requirements?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

c	Is the well in a high traffic area and does the well require protection from traffic?	_____	<u>X</u>	_____
d	Is the drainage around the well acceptable? (no standing water, nor is well located in obvious drainage flow path)	<u>X</u>	_____	_____
2 Protective Casing				
a	Is the protective casing free from apparent damage and able to be secured?	<u>X</u>	_____	_____
b	Is the casing free of degradation or deterioration?	<u>X</u>	_____	_____
c	Does the casing have a functioning weep hole?	<u>X</u>	_____	_____
d	Is the annular space between casings clear of debris and water, or filled with pea gravel/sand?	<u>X</u>	_____	_____
e	Is the well locked and is the lock in good condition?	<u>X</u>	_____	_____
3 Surface pad				
a	Is the well pad in good condition (not cracked or broken)?	<u>X</u>	_____	_____
b	Is the well pad sloped away from the protective casing?	<u>X</u>	_____	_____
c	Is the well pad in complete contact with the protective casing?	<u>X</u>	_____	_____
d	Is the well pad in complete contact with the ground surface and stable? (not undermined by erosion, animal burrows, and does not move when stepped on)	<u>X</u>	_____	_____
e	Is the pad surface clean (not covered with sediment or debris)?	<u>X</u>	_____	_____
4 Internal casing				
a	Does the cap prevent entry of foreign material into the well?	<u>X</u>	_____	_____
b	Is the casing free of kinks or bends, or any obstructions from foreign objects (such as ballers)?	<u>X</u>	_____	_____
c	Is the well properly vented for equilibration of air pressure?	<u>X</u>	_____	_____
d	Is the survey point clearly marked on the inner casing?	<u>X</u>	_____	_____
e	Is the depth of the well consistent with the original well log?	<u>X</u>	_____	_____
f	Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction)	<u>X</u>	_____	_____
5 Sampling: Groundwater Wells Only:				
a	Does well recharge adequately when purged?	<u>X</u>	_____	_____
b	If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater plan for the facility?	<u>X</u>	_____	_____
c	Does the well require redevelopment (low flow, turbid)?	_____	<u>X</u>	_____
6 Based on your professional judgement, is the well construction / location appropriate to 1) achieve the objectives of the Groundwater Monitoring Program and 2) comply with the applicable regulatory requirements?				
		<u>X</u>	_____	_____

Professional Groundwater Scientist Certification

I certify that I am a qualified ground-water scientist who has received a baccalaureate or post-graduate degree in the natural sciences or engineering and have sufficient training and experience in groundwater hydrology and related fields, as demonstrated by state registration and completion of accredited university courses, that enable me to make sound professional judgments regarding groundwater monitoring and contaminant fate and transport. I further certify that this report was prepared by myself or by a subordinate working under my direction. We certify that the information included is to the best of our knowledge and belief, true, accurate and complete. In preparing this report, we have relied on information provided by Southern Company Services and Georgia Power.

1.0 INTRODUCTION

Georgia Power's Plant Bowen solid waste disposal facility (Site) is located in Bartow County off State Highway 113, approximately 7 miles west-southwest of Cartersville and 20 miles southeast of Rome. The disposal facility is approximately 300 acres located on a previously undeveloped, contiguous portion of the plant property. The Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10 are located on the northeast portion of the Plant Bowen property. The disposal facility receives coal combustion by-products, coal ash and gypsum, from coal power generating processes at the Site. The landfill cells are lined in accordance with Solid Waste Permit No. 008-018D (LI). A well network around each of the active disposal cells monitors the groundwater conditions at the Site. The monitoring well locations are shown in **Figure 1: Location of Replacement Well GWA-36A**.

This report provides details for the installation of monitoring well GWA-36A and abandonment of monitoring wells GWA-4 and GWA-36. Well construction details are included in **Table 1: Summary of Monitoring Well Construction** and locations are shown in **Figure 1**. The surveyed coordinates and elevations of GWA-36A are provided in a certified well survey report in **Appendix A: Well Survey Document**.

GWA-36 exhibited persistent high turbidity during the January-February 2022 semi-annual groundwater sampling event and did not decrease below 5 Nephelometric Turbidity Units (NTUs) after several attempts of redevelopment. Further investigation identified possible filter pack sand in the pump used for purging and sampling GWA-36. The existing well GWA-36 was abandoned and replaced by new well GWA-36A due to likely well construction issues. Replacement well GWA-36A was located less than 50 feet adjacent to GWA-36. The well screen of GWA-36A was placed to intercept a water-bearing zone in the overburden similar to GWA-36.

Groundwater level measurements in GWA-4, GWA-4R, and GWA-4RZ from March 2016 through January 2022 indicate that the potentiometric surface in the upper aquifer is consistently measured at a lower elevation than the screened interval of GWA-4. Per the Georgia EPD Solid Waste Management Rule 391-3-4-.10(6)(g), monitoring wells require replacement after two dry sampling events. Well GWA-4 was abandoned without replacement due to the lack of continuous and persistent groundwater present in the overburden. GWA-4R and GWA-4RZ water levels will continue to be measured and represent the groundwater elevation at this location in the upper aquifer.

2.0 DRILLING AND WELL INSTALLATION

The following sections provide details and description of drilling methodology, materials and installation procedures used in constructing the monitoring well GWA-36A. Monitoring well construction details are summarized in **Table 1**.

2.1 Drilling Method

Wood provided oversight and documented the drilling and installation of monitoring well GWA-36A by Cascade Drilling, under contract with Southern Company, from March 16 through 18, 2022. A copy of the Water Well Contractor's performance bond is provided in **Appendix B: Well Construction and Boring Logs**. The drilling was performed using roto-sonic technology with a Terra Sonic, compact, track-mounted drill rig. A hand-auger was used to check the upper 10 feet of the well location to provide clearance of potential underground utilities.

Following subsurface clearance, a 4-inch diameter sampling core barrel and tooling, followed by a 6-inch override (outer) casing, was advanced via sonic methodology to a final depth of 102.9 feet (577.7 feet above North America Vertical Datum of 1988 (NAVD88)) for the purpose of collecting soil and rock for lithologic characterization and subsequent well installation. Soil and/or rock were collected continuously, in core runs up to 10 feet, from near the ground surface to the boring termination depth. Upon completion of a core run, prior to retracting the core barrel, 6-inch override (outer) casing was advanced over the 4-inch core barrel and tooling to maintain borehole integrity. Once the override casing was in place, the core barrel was retracted from the borehole and the soil and/or rock sample were extruded into a plastic sleeve and provided to the Wood field representative for characterization, documentation, photographing, and archival in wooden sample storage boxes (see **Appendix B**). After sample retrieval, the core barrel was advanced, and another core run was completed. This process was continued until the target depth was reached where bedrock was encountered.

Upon reaching the target depth, the 6-inch override casing was used to flush/clean-out the borehole and left in place for well construction. The well was installed directly through the override casing. The screen and casing (riser) were placed in the override casing and the annular space was filled (i.e., emplacement of the filter pack, bentonite, and grout) as the override casing was retracted.

2.2 Screened Interval

Well GWA-36A is screened in the overburden and was constructed with ten feet of well screen as shown in the Well Construction Log provided in **Appendix B**. The former well, GWA-36, was constructed with a screened interval depth of 65.7 to 75.7 feet below ground surface (bgs) (616.19-606.19 feet, NAVD88) which was a shallower elevation than GWA-36A screened interval

(588.80-578.80 feet, NAVD88). Well GWA-36A was installed to a greater depth due to the depth to bedrock being deeper at the new well location than the GWA-36 location.

2.3 Well Casing and Screens

The monitoring well is constructed of 2-inch inside diameter Schedule 40 polyvinyl chloride (PVC) casing (riser) and pre-packed Number 10 slot (0.010-inch aperture) screen. The pre-pack screens are comprised of a 10-foot-long section of slotted PVC “U-pack” pre-pack screen. Each pre-pack screen used in the construction of the well was manually filled with sand and then attached to the riser section of the well casing. Well construction materials are designed to be sufficiently durable to resist chemical and physical degradation and not interfere with the quality of groundwater samples. The casing and screen sections were flush-threaded and did not require the use of solvent or adhesive to construct the well.

The well was designed and constructed to:

- 1) allow sufficient groundwater flow to the well for sampling;
- 2) minimize the passage of formation materials (turbidity) into the well; and,
- 3) ensure sufficient structural integrity to prevent collapse of the well.

2.4 Filter Pack

The filter pack material is designed to be chemically inert, clean, well-graded, well-rounded, dimensionally stable, silica (quartz) sand of which the 80 to 90 percent retained size is 0.010-inch diameter (the screen aperture). The filter pack sand used for the construction of the monitoring well was the 20/40 mesh sand from the supplier (Covia). The pre-pack screen was filled with the filter pack sand prior to insertion into the borehole. The filter pack material was mixed with water and emplaced in the annular space between the outside of the pre-pack screen and borehole wall to ensure an adequate thickness of filter pack material between the well and the formation. The filter pack was extended approximately three feet above the top of the screen. After installing the filter pack, the well was pumped to allow settlement of the filter pack material, prior to installing the annular seal. The filter pack depth/interval is documented in the well construction log provided in **Appendix B**.

2.5 Annular Seal

After installing the filter pack, a bentonite seal was constructed to a thickness coinciding with the observed elevation of the water table during drilling. Bentonite pellets and chips were emplaced in the annular space directly above the filter pack to seal the annulus and prevent vertical flow of water along the well casing. The non-coated bentonite pellets were placed from the top of the filter pack to a thickness of approximately 2.4 feet. The bentonite used for the

construction of the well was 3/8-inch, non-coated pellets (PDS Pel-Plug). The bentonite pellets were allowed to hydrate for eighteen hours and settle in accordance with the manufacturer's recommendations prior to adding more well sealing materials into the annular space above the pellets. The bentonite seal was subsequently extended from the top of the pellets to near the water table at approximately 29 feet below ground surface by the addition of 3/8-inch bentonite chips (Haliburton Hole-plug). The bentonite chips were hydrated. The bentonite seal was extended up to the water table to reduce the potential of the grout impacting nearby well GWA-36RA.

After the bentonite chips were adequately hydrated, the remaining annular space was sealed using AQUAGUARD by Baroid Industrial Drilling Products, a sodium bentonite blended grout. The grout was prepared in accordance with manufacturer's instructions and emplaced from the top of the bentonite seal to the near ground surface via tremie method. The grout was injected at a low velocity as to not displace the bentonite seal and the tremie pipe was raised as grout filled the annular space. Grout was injected via tremie method from a depth of approximately 29 feet to within two feet of ground surface.

A concrete seal extends from approximately two feet below ground surface to grade and was formed into a slightly mounded cement apron extending outward to help direct rainwater run-off away from the well. The well pad dimensions were 4 feet by 4 feet with a thickness of 4 inches.

2.6 Cap and Protective Casing

Well GWA-36A was fitted with a sealable cap and a lockable, 4-inch square, aluminum, above-grade (stick-up) protective casing installed over the well to protect the PVC riser from damage and secure it from unauthorized access. The annular space between the well riser and protective casing was filled with pea-size gravel and a small weephole was drilled near the base to allow for drainage from inside the protective casing. Additionally, bollards were installed at the corners of the concrete pad to protect the well. Prior to leaving the site, the well was secured with a padlock, keyed specific to the site. Well construction details are documented in **Appendix B**.

3.0 WELL DEVELOPMENT

GWA-36A was developed using an electric submersible pump to restore the natural hydraulic conductivity of the formation and to remove fine-grained sediment to help ensure low-turbidity groundwater samples. The well was alternately surged and purged until visually clear of particulates. Groundwater quality parameters turbidity, pH, specific conductivity, temperature, dissolved oxygen (DO), and oxidation-reduction potential (ORP) were recorded during development to ensure that the well was fully developed.

Development of the groundwater monitoring well continued until criteria indicating adequate development was achieved. Development is generally recognized as being complete when the well yields water with a turbidity less than 5 NTUs and the pH and specific conductivity has stabilized (i.e., pH within 0.1 standard unit and specific conductivity within 5% over three consecutive measurements). The development forms are included in **Appendix C: Well Development Forms**.

Prior to deploying the development pump into the well, the pump was decontaminated and fitted with new disposable tubing. New disposable, nitrile gloves were worn throughout the development process, including when initially deploying the pump, handling the pump and tubing while surging, and during decontamination activities.

4.0 SURVEY

Well location, top of casing (TOC) elevation, and ground surface elevation were surveyed by Donaldson Garrett & Associates, Inc. Northings and easting are in feet relative to Georgia State Plane, West Zone, North America Datum of 1983 (NAD 83) and surveyed with a horizontal accuracy of 0.5 feet. TOC and ground surface elevations are in feet relative to North American Vertical Datum of 1988 (NAVD88) and surveyed with a vertical accuracy of 0.01 feet. Survey data are included in **Table 1**. Well survey documents are provided in **Appendix A: Well Survey Document**.

5.0 WELL ABANDONMENT

Wells GWA-4 and GWA-36 were abandoned following USEPA Region 4 guidance for well abandonment procedures. Well GWA-4 was constructed approximately 20 feet into bedrock. The well was abandoned by filling the screened interval and up to the soil-bedrock interface with bentonite chips and hydrated. The well casing was overdrilled from the ground surface to the soil-bedrock interface with the six-inch overdrive casing. The well casing above the soil-bedrock interface was removed. The overdrilled interval was filled with bentonite chips up to the water table at approximately 41 feet, bgs. AQUAGUARD by Baroid Industrial Drilling Products, a sodium bentonite blended grout, was emplaced from the top of the bentonite chips to the ground surface utilizing the tremie method. The grout was prepared in accordance with manufacturer's instructions and emplaced from the top of the bentonite seal to the ground surface via tremie method. The grout was injected at a low velocity as to not displace the bentonite seal and the tremie pipe was raised as grout filled the annular space. Grouting ceased when the grout mixture daylighted at the surface as visible grout.

Well GWA-36 was constructed to the top of bedrock. The well screen was found to be filled with about seven feet of sediment, primarily filter pack sand. The sediment could not be pumped or flushed from the well screen. Well GWA-36 was overdrilled from the ground surface to the bottom of the well. The well screen and casing were removed from the borehole. Bentonite chips were placed from the bottom of the borehole to the top of the water table and hydrated. The bentonite chips were used to prevent the grout from potentially impacting nearby wells. The interval from the ground surface to the top of the bentonite was filled with AQUAGUARD by Baroid Industrial Drilling Products, a sodium bentonite blended grout via tremie method. The grout was injected at a low velocity as to not displace the bentonite seal and the tremie pipe was raised as grout filled the annular space. Grouting ceased when the grout mixture daylighted at the surface as visible grout. For details on the abandonment of GWA-4 and GWA-36, see **Appendix D: Well Abandonment Documents**.

WELL CONSTRUCTION AND BORING LOGS

WELL INSTALLATION RECORD

JOB NAME Plant Bowen Cells 3 & 4	PROJECT NO. 6122-16-0287
WELL NUMBER GWA-36A	INSTALLATION DATE 3/18/2022
LOCATION* NORTH: 1505026.95 EAST: 2073357.46	GROUND ELEV: 680.63 feet NAVD88
WOOD FIELD REPRESENTATIVE T. Parker	DRILLER/ CONTRACTOR C. Franklin/Cascade
GRANULAR BACKFILL MATERIAL 20/40 mesh Silica Filter Sand	DRILLING TECHNIQUE Rotosonic
SCREEN MATERIAL 2-inch I.D. Flush Joint Slotted PVC (Sch. 40)	BOREHOLE DIAMETER ± 6 inch
SLOT SIZE 0.010-inch Machine Cut	REFERENCE POINT** ELEVATION* 683.75 ft NAVD88
RISER MATERIAL 2-inch I.D. Flush joint Solid PVC (Sch. 40)	LOCK TYPE/KEY CODE Master

* Preliminary-Final location/elevation to be determined by As-Built Survey
 ** Reference point is notch cut in the top of PVC casing

NOTE: NOT TO SCALE, ALL DEPTHS RECORDED ARE
 RELATIVE TO EXISTING GROUND SURFACE AT TIME OF
 INSTALLATION

Notes:
 Sand – 6.5 bags of 20/40 mesh sand for prepack & screen interval
 Bentonite – 3 buckets 3/8" uncoated pellets for bentonite seal above the sand filter pack; 7 bags of 3/8" chips added to bring level up to water table
 Grout – 2 bags of Aqua-guard® bentonite/grout mix with –40 gals water

Review: RNQ Date: 3/27/2022

APPENDIX D

WELL ABANDONMENT DOCUMENTS

MONITORING WELL ABANDONMENT RECORD

WELL NO.: GWA-4

PROJECT NAME: GP-Plant Bowen Landfill

PROJECT NO.: 6122 16 0287

DATE: 3/14/2022

Name of Property Owner: Georgia Power Company

Address of Property: 317 Covered Bridge Road Euharlee, Bartow County, Georgia

Original Purpose of Well Installation: Monitoring well for water quality and levels in overburden upgradient of Cells 1&2

Total Depth of Well

(Measured from Top of Riser): 72.30 ft btoc

Total Well Depth: 69.64 ft bgs

Total

Boring Depth: 69.5 ft bgs

Well Diameter: 2 inches

Screen Slot Size: 0.01 - inch

Length of Screen: 10 ft (59.49 to 69.49 ft bgs)

Depth to Water/Date

(Measure from Top of Riser): well is dry, no water

Description of Well Abandonment Method: Filled well screen and riser up to 47 ft bgs with Haliburton Hole-plug bentonite chips 3/8"-size and hydrated. Overdrilled from ground surface to soil-bedrock interface and removed well casing.

Filled interval from ground surface to soil-bedrock interface with bentonite chips and Aqua-guard bentonite blend grout.

Type and Volume of Materials Used to Plug Well/Borehole: Bentonite chips and Aqua-guard Gallons of: 160 gal Aqua-guard

Riser and Screen Removed or Left in Place: Screen and riser from 49 to 69.6 ft bgs left in place. Casing from ground surface down to soil-bedrock interface at 49 ft bgs removed.

Drilling Contractor Cascade

Driller's Name Cory Franklin

Additional Notes: Initiated well abandonment by removing the protective cover and well pad and bollards. Top of bedrock was at 49 ft bgs. Well screen and casing below soil-bedrock interface at 49 ft bgs filled with bentonite chips (1 bag) and casing left in-place. Overdrilled and removed casing from ground surface to soil-bedrock interface at about 49 ft bgs. Initial application of Aqua guard did not bring the grout level up to the surface. Added 2.5 bags of Hole-plug bentonite chips to overdrilled interval and hydrated. Bentonite chips brought up to 41 ft bgs. Tremie-grouted more Aqua-guard into overdrilled interval and brought the level up to the ground surface.

Wood Environment & Infrastructure Solutions Field Representative

Date Well Abandonment Completed: 3/15/2022

MONITORING WELL ABANDONMENT RECORD

WELL NO.: GWA-36

PROJECT NAME: GP-Plant Bowen Landfill

PROJECT NO.: 6122 16 0287

DATE: 3/15/2022

Name of Property Owner: Georgia Power Company

Address of Property: 317 Covered Bridge Road Euharlee, Bartow County, Georgia

Original Purpose of Well Installation: Monitoring well for water quality and levels in overburden upgradient of Cells 3&4

Total Depth of Well

(Measured from Top of Riser): 69.1 ft btoc

Total Well Depth: 76.0 ft bgs

Total

Boring Depth: 76.0 ft bgs

Well Diameter: 2 inches

Screen Slot Size: 0.01 - inch

Length of Screen: 10 ft (65.7 to 75.7 ft bgs)

Depth to Water/Date

(Measure from Top of Riser): 30.8 ft btoc

Description of Well Abandonment Method: Overdrilled well casing to 76 ft bgs and removed screen and casing. Filled overdrilled interval from 76 ft bgs to about 30.2 ft bgs with Haliburton Hole-plug bentonite chips 3/8"-size and hydrated overnight. Tremie-grouted with Aqua-guard bentonite blend grout from ground surface to 30.2 ft bgs.

Type and Volume of Materials Used to Plug Well/Borehole: Bentonite chips and Aqua-guard Gallons of: 60 gal Aqua-guard About 9 bags of bentonite chips and 2 five-gallon buckets of bentonite pellets.

Riser and Screen Removed or Left in Place: Screen and riser from 0 to 76 ft bgs removed.

Drilling Contractor Cascade

Driller's Name Cory Franklin

Additional Notes: Initiated well abandonment by removing the protective cover and well pad and bollards. Overdrilled and removed screen and casing from ground surface to 76 ft bgs. The well screen was filled with about 7 feet of sediment that could not be flushed or pumped out of the well. Filter-pack sand was found in the sampling pump in the well during the January 2022 sampling event. Emplaced about 9 bags of Hole-plug bentonite chips and 2 five-gallon buckets of bentonite pellets from 76 ft bgs to about 30.2 ft bgs and hydrated after well casing was overdrilled. Bentonite chips brought up to top of water table. Tremie-grouted Aqua-guard bentonite blend grout from 30.2 ft bgs up to the ground surface.

APPENDIX C

MEMORANDA ON HYDROGEOLOGIC MONITORING PROGRAM

To:	Kristen Jurinko, P.G. Southern Company Services, Inc.	From:	Andreas Shoredits, P.G. Stantec Consulting Services Inc.
File:	Hydrogeological Monitoring Memo	Date:	August 31, 2022

Reference: Solid Waste Disposal Facility Permit No. 008-018D (LI) - Hydrogeological Monitoring Program December 16, 2021, through June 3, 2022

Background

Stantec Consulting Services Inc. (Stantec) was retained by Southern Company Services, Inc. (SCS), to assist with the hydrogeological (water level) monitoring program at Georgia Power Company's Plant Bowen (Site) Landfill Cells 1 & 2, 3 & 4, 9 & 10. The work is being conducted to comply with Georgia Department of Natural Resources Environmental Protection Division (EPD) Solid Waste Permit No. 008-018D (LI) to assist with early detection of subsurface changes that might indicate land subsidence or sinkhole formation. Groundwater level fluctuations are monitored in accordance with Section 3.6.5 of the *Plant Bowen Proposed Coal Combustion By-Product Monofill Addendum I Site Acceptability Report – Hydrogeological Assessment and Demonstration of Engineering Measures* (SCS 2004)⁽¹⁾.

The Site utilizes In-Situ[®] Instruments, Inc. Win-Situ[®] telemetry and reporting software and pressure transducers to collect and record groundwater elevations from monitoring wells located around the perimeter of the landfill cells. The program was initiated in 2014 at Cells 1 & 2, expanded in 2015 and 2016 to Cells 3 & 4 and Cells 9 & 10, respectively. During this reporting period transducers were deployed in overburden and bedrock wells as follows:

- Cells 1 & 2: six overburden wells (GWA-1 (overburden/bedrock), GWA-3A, GWC-7Z, GWC-11, GWC-13, and GWC-15) and six bedrock wells (GWA-2R, GWC-6RZ, GWC-8RR, GWC-11R, GWC-13R, and GWC-15R).
- Cells 3 & 4: five overburden wells (GWC-18, GWA-36A, GWA-37, GWA-53, and GWA-55) and eight bedrock wells (GWC-16R, GWC-18R, GWC-21R, GWC-24R, GWC-25R, GWA-36RA, GWA-53R, and GWA-55R).
- Cells 9 & 10: six overburden wells (GWA-39Z, GWA-41, GWA-43, GWC-45, GWC-47, and GWC-49Z) and six bedrock wells (GWA-39RZ, GWA-41R, GWA-43R, GWC-45R, GWC-47R, and GWC-49R).
- Etowah River levels and rainfall data for the reporting period were obtained from a U.S. Geological Survey gauge (02394670) near Cartersville, Georgia.

Water level data are electronically logged multiple times daily by each transducer. Most logged data are uploaded after each reading via satellite telemetry to a central In-Situ Inc.® database. Automated reports are accessible via the In-Situ® database website (ISI Data Center) where the telemetry data are stored and compiled. Data from wells not connected to the site telemetry system are manually downloaded directly from

Reference: Solid Waste Disposal Facility Permit No. 008-018D (LI) - Hydrogeological Monitoring Program December 16, 2021, through June 3, 2022

these transducers, because the transducers are set to log and store data internally multiple times throughout each day.

Maintenance Observations

During the reporting period, the following well locations were noted by Southern Company Civil Field Services (SCS-CFS) staff as having issues: GWA-3A, GWA-36A, GWC-25R, and GWC-49R. The wells were visited on one or more occasions for maintenance, manual data downloads, battery change outs, transducer replacement, desiccant replacement, solar panel adjustment, or reconnection of modem or transducer cables. Monitoring well GWA-36 was abandoned on March 16, 2022 and replaced with new monitoring well GWA-36A on March 18, 2022. A new transducer has not been installed in new well GWA-36A. The data, during this reporting period, for the transducer location at GWA-36 are not continuous due to this transducer being offline due to drilling activities. During the past six-month period, transducers from wells GWA-3A, GWC-25R, and GWC-49R were visited to troubleshoot telemetry system. SCS-CFS staff have identified the potential issues associated with GWC-25R, and GWC-49R are working on correcting these in time for the upcoming hydrogeological monitoring period. After early February 2022, the data upload issues continued at GWA-3A. Historically, the groundwater elevations in GWA-3A have been consistent with GWA-2R, which did not show water level fluctuations attributed to subsurface changes that might be indicative of land subsidence or sinkhole formation. The ongoing data upload issues associated with GWA-3A have yet to be resolved and are being worked on.

Water Level Fluctuations

Continuous groundwater level data and river stage elevations were recorded between December 16, 2021, and June 3, 2022. Reporting period hydrographs for Cells 1 & 2, 3 & 4, and 9 & 10 are shown in Figures 1A through 3B.

Table 1 lists the groundwater sampling, water level gauging and transducer maintenance activities during the reporting period and are considered known disruptions to water table. Table 2 summarizes the data gaps or maintenance issues for the reporting period and recommendations for repairs and includes the most recent repairs completed up to May 10, 2022. Repairs consisted of resetting reference water elevation depth, resealing boxes, ant infestation control, replacing desiccants and replacing power controller units and batteries. Periodic sampling and maintenance may induce drifts in pressure readings. When significant drifts are noted, the reference depth to water is re-set and the logging cycle is re-started. Table 2 is a record of the maintenance completed during the reporting period.

The water levels in monitoring wells equipped with transducers exhibited similar overall trends during the reporting period. Groundwater elevations show an overall stable trend during this six-month period with lower elevations through December followed by elevated water levels and monthly peaks in January, February, and March. There is a steady decrease in groundwater elevations from April through May. The fluctuations of groundwater elevations mimic the Etowah River levels in response to rain events and wet conditions. Some of this hydrograph response may be attributable to the fluctuations in water levels in the nearby General Service Water Pond. Wells GWA-41 and GWA-41R showed rapid hydrograph responses to rainfall during the monitoring period as groundwater in both the overburden and bedrock aquifers at this location responded equally to rainfall events. During this monitoring period, the potentiometric surface of the bedrock aquifer remained above the top of competent bedrock in the instrumented monitoring wells. This higher hydrostatic

Reference: Solid Waste Disposal Facility Permit No. 008-018D (LI) - Hydrogeological Monitoring Program December 16, 2021, through June 3, 2022

pressure of the bedrock aquifer limits removal of material from the overburden that could result in subsidence issues. The observed variations in groundwater elevations are attributed to rainfall variations, or due to sampling or maintenance activities at the monitoring points. A comparison of river stage and precipitation data with recorded groundwater elevations (Figures 1A through 3B) shows that both sets of data follow similar overall patterns.

Conclusions and Recommendations

Observed disruptions in the transducer water levels were found to be directly attributed to (a) drawdown during sampling events, water level gauging, well development, and (b) to maintenance of wells, transducers, or telemetry units, or (c) significant rainfall events. The December 16, 2021, through June 3, 2022, hydrologic monitoring data did not show water level fluctuations attributed to subsurface changes that might be indicative of land subsidence or sinkhole formation. Based on our interpretation of data for the current reporting period (December 16, 2021, through June 3, 2022), Stantec can recommend the following measures towards improving the program:

- Quarterly comprehensive field calibration of transducer groundwater elevations to correct for pressure data drifts and identify faulty sensors.
- Continue to perform periodic maintenance of the system and provide record of maintenance documentation digitally.
- Manually download data, monthly, when a telemetry unit is offline (i.e., not transmitting data to the ISI Data Center). This will ensure that data are being reviewed on a consistent and timely basis.
- Field check equipment to make certain insect infestation is not damaging equipment and verify battery level status of transducers periodically as those with low levels will need to be replaced.
- Replace desiccants in stations on a scheduled manner.
- Maintain vegetation clearance around telemetry stations to continue to allow sunlight reaching the solar panels to charge station batteries.

LABORATORY ANALYTICAL DATA AND

FIELD SAMPLING REPORTS

March 10, 2022

Joju Abraham
Georgia Power-CCR
2480 Maner Road
Atlanta, GA 30339

RE: Project: BOWEN LF CELLS 3&4
Pace Project No.: 92585058

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory between January 28, 2022 and February 01, 2022. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Charlotte
- Pace Analytical Services - Peachtree Corners, GA
- Pace Analytical Services - Minneapolis

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Nicole D'Oleo

QUALIFIERS

Project: BOWEN LF CELLS 3&4
Pace Project No.: 92585058

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.
ND - Not Detected at or above adjusted reporting limit.
TNTC - Too Numerous To Count
J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.
MDL - Adjusted Method Detection Limit.
PQL - Practical Quantitation Limit.
RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.
S - Surrogate
1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.
Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.
LCS(D) - Laboratory Control Sample (Duplicate)
MS(D) - Matrix Spike (Duplicate)
DUP - Sample Duplicate
RPD - Relative Percent Difference
NC - Not Calculable.
SG - Silica Gel - Clean-Up
U - Indicates the compound was analyzed for, but not detected.
Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.
A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.
N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.
Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.
Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.
TNI - The NELAC Institute.

ANALYTE QUALIFIERS

B Analyte was detected in the associated method blank.
BC The same analyte was detected in an associated blank at a concentration above 1/2 the reporting limit but below the laboratory reporting limit.
M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full,
without the written consent of Pace Analytical Services, LLC.

Laboratory receiving samples:

Asheville Eden Glenwood Huntersville Raleigh Mechanicsville Atlanta Kernersville

Company ID: 10000000000000000000

Client Name:

Project ID:

WO#: 92585058

Country: International

Product: Part

Material: Part

Process: Other

Other:

Confidentiality: Yes

Seal Intact? Yes

Date/Time of Receipt (including time zone): 11/22/21 17:28

Marking Material: Double Wrap

Double Bags: None

Other:

Biological Material Present? Yes

No

Temperature: Ambient

Refrigerated: Dry Ice

Other:

Temp. and/or other special handling instructions: Do not use for testing

Do not use for testing in any form or on any testing process. No testing.

Cooler Temp.: 50

Compressor Fan: Add. battery (AC)

Cooler Temp. (expected) (%): S.I.

USDA Regulated Soil? With water sample?

Do I need to complete a questionnaire form within the next 10 days (if you do, please email)?

Do I need to complete a questionnaire form within the next 10 days (if you do, please email) including Hazardous Waste forms? Yes

No

Do I need to complete a questionnaire form within the next 10 days (if you do, please email)?

RE: Project: BOWEN LF CELLS 9&10
Pace Project No.: 92585555

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory between February 01, 2022 and February 04, 2022. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Charlotte
- Pace Analytical Services - Peachtree Corners, GA
- Pace Analytical Services - Minneapolis

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Nicole D'Oleo

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full, without the written consent of Pace Analytical Services, LLC.

QUALIFIERS

Project: BOWEN LF CELLS 9&10

Pace Project No.: 92585555

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

B Analyte was detected in the associated method blank.

D6 The precision between the sample and sample duplicate exceeded laboratory control limits.

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

Document Name:
Sample Condition Upon Receipt (SCUR)
Document No.:
F-CAR-CI-033-Rev.08

Document Revised: November 15, 2021
Page 1 of 3
Issuing Authority:
Pace Carolina Quality Office

Laboratory receiving samples:

Asheville Eden Greenwood Huntersville Raleigh Mechanicsville Atlanta Kernersville

Sample Condition Upon Receipt

Client Name: G-A Power Project #: W0# : 92585555

Courier: Fed Ex UPS USPS Client Commercial Other: Direct

Custody Seal Present? Yes No Seal Intact? Yes No

Packing Material: Bubble Wrap Bubble Bags None Other

Biological Tissue Frozen? Yes No N/A

Thermometer: IR Gun ID: 230 Type of Ice: Wet Dry None

Cooler Temp: 4.8 Correction Factor: Add/Subtract (°C) +0.2

Temp should be above freezing to 6°C
 Samples out of temp criteria. Samples on ice, cooling process has begun

Cooler Temp Corrected (°C): 5.0

USDA Regulated Soil (N/A, water sample)
Did samples originate in a quarantine zone within the United States: CA, HI, or SC (check maps)?

Did samples originate from a foreign source (internationally, including Hawaii and Puerto Rico)? Yes No

RE: Project: BOWEN LF CELLS 1&2
Pace Project No.: 92586436

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory between February 04, 2022 and February 18, 2022. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Charlotte
- Pace Analytical Services - Peachtree Corners, GA
- Pace Analytical Services - Minneapolis

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Nicole D'Oleo
nicole.d'oleo@pacelabs.com

QUALIFIERS

Project: BOWEN LF CELLS 1&2

Pace Project No.: 92586436

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

B Analyte was detected in the associated method blank.

D6 The precision between the sample and sample duplicate exceeded laboratory control limits.

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full,
 without the written consent of Pace Analytical Services, LLC.

Document Name:
Sample Condition Upon Receipt (SCUR)
Document No.:
P-CAR-CS-033-Rev.08

Document Revised: November 25, 2020
Page 1 of 3
Issuing Authority:
Pace Carolina Quality Office

Laboratory receiving samples:

Asheville Eden Greenwood Huntersville Raleigh Mechanicsville Atlanta Kernersville

Sample Condition
Upon Receipt

Client Name:
GA Power

Project #: **WO# : 92586436**

Courier: Fed Ex UPS USPS Other
 Commercial Pace Other

Custody Seal Present? Yes No Seals Intact? Yes No

Date/Initials Person Examining Contents: JPE 2/17/22

Packing Material: Bubble Wrap Bubble Bags None Other
Thermometer: IR Gun ID: 230 Type of Ice: Wet Blue None

Biological Tissue Frozen?
 Yes No N/A

Cooler Temp: 55 Correction Factor: Add/Subtract (°C) +2

Temp should be above freezing to 6°C
 Samples out of temp criteria - Samples on ice, cooling process has begun

Cooler Temp Corrected (°C): 57

USDA Regulated Soil (N/A, water sample)

Did samples originate in a quarantine zone within the United States: CA, NY, or SC (check maps)?
 Yes No

Did sample originate from a foreign source (internationally, including Hawaii and Puerto Rico)? Yes No

		Comments/Discrepancy:	
Chain of Custody Present?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	1	
Samples Arrived within Hold Time?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	2	
Start Hold Time Analysis (x72 hr.)?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> N/A	3	
Batch Turn Around Time Requested?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> N/A	4	
Sufficient Volume?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	5	
Correct Containers Used?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	6	
Pace Containers Used?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A		
Containers Intact?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	7	
Dissolved analysis: Samples Field Filtered?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	8	
Sample Labels Match COC?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	9	
Includes Date/Time/ID/Analysis Matrix:	<u>WT</u>		
Headspace in VOA Vials (>3 Sites)?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	10	
Trip Blank Present?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A	11	
Trip Blank Custody Seals Present?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input checked="" type="checkbox"/> N/A

RE: Project: BOWEN LF CELLS 3&4
Pace Project No.: 92597519

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on April 06, 2022. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Charlotte
- Pace Analytical Services - Peachtree Corners, GA
- Pace Analytical Services - Minneapolis

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Nicole D'Oleo
nicole.d'oleo@pacelabs.com

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full, without the written consent of Pace Analytical Services, LLC.

QUALIFIERS

Project: BOWEN LF CELLS 3&4

Pace Project No.: 92597519

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

H1 Analysis conducted outside the EPA method holding time.

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

R1 RPD value was outside control limits.

RE: Project: BOWEN LANDFILL
Pace Project No.: 92601912

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on April 29, 2022. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Charlotte
- Pace Analytical Services - Peachtree Corners, GA

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Nicole D'Oleo
nicole.d'oleo@pacelabs.com

QUALIFIERS

Project: BOWEN LANDFILL

Pace Project No.: 92601912

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

Data Evaluation Narrative

**Project: Plant Bowen CCR Event # 18 Groundwater Detection Monitoring/
Semiannual State Design and Operation Permit Monitoring**

Wood Project Number: 6122160287.2103.****

Site: Landfill Cells 3 & 4 - Plant Bowen, Georgia

Matrix: Groundwater

Pace SDG No: 92585058

Introduction

A data quality evaluation (DQE) was performed on the laboratory data reported for the CCR Event # 18 Groundwater Detection Monitoring Sampling Event and the Semiannual State Design and Operation (D&O) Permit sampling event conducted at Landfill Cells 3 & 4 at Plant Bowen, located in Cartersville, Georgia in January 2022. The samples were collected and analyzed per the protocols presented in the Plant Bowen *Field Sampling Plan* (FSP), Revision 1, Update 3 (Amec Foster Wheeler, 2017). The following sections provide summary discussions of the required data qualifications for the methods for samples collected. A Level II DQE validation was performed on the samples analyzed by the fixed-based laboratory within these sample delivery groups (SDGs). A Level II DQE consists of review of the following criteria: sample integrity, holding times, method blanks, laboratory control samples (LCSs), matrix spikes/matrix spike duplicate (MS/MSD) recoveries and relative percent differences (RPDs), post digestion spikes (PDS), where applicable, laboratory and field duplicate RPDs, field and/or equipment blanks, and reporting limits. Additionally, the data summary tables generated from the electronic data deliverable (EDD) were compared to the laboratory hardcopy data report to verify that the EDD and laboratory data report agree.

The data were reviewed using the laboratory's precision and accuracy limits, the method requirements, and any requirements listed in the FSP. It should be noted that at the time of this review, a finalized QAPP was not provided. DQE data qualifications were applied, if necessary, using the procedures in USEPA National Functional Guidelines for Inorganic Data Review (USEPA, 2020), as guidance, and professional judgment using the following qualifiers:

<u>Qualifier</u>	<u>Usable Data</u>
J	The analyte was positively identified but the result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample. <i>SCS Definition: Value J indicates the substance was detected at such low levels that the precision of the laboratory instruments could not produce as reliable of a value. Therefore, the value displayed (value J) is qualified by the laboratory as estimated.</i>
UJ	The analyte was analyzed for but was not detected above the level of the reported sample reporting/method detection limit. The reported method detection limit is approximate and may be inaccurate or imprecise.
U	Analyte was analyzed for but was not detected above the level of the reported sample reporting/method detection limit. <i>Note: SCS does not use the "U" flag except when reporting results for radium that are detected below the Minimum Detection Concentration (MDC).</i>
U*	This analyte should be considered "not-detected" because it was detected in an associated blank at a similar level.

<u>Qualifier</u>	<u>Unusable Data</u>
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet QC criteria. The presence or absence of the analyte cannot be confirmed.
UR	The analyte was analyzed for but was not detected above the level of the reported sample reporting or method detection; however, the data are unusable. The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The analyte may or may not be present in the sample.

The analytical results for the samples reported in this SDG are usable with the qualifications discussed in this narrative. A summary of the data with associated qualifiers is presented in **Table 1**.

Deliverables

The data package as submitted to Wood Environment & Infrastructure Solutions, Inc. (Wood, formerly Amec Foster Wheeler) is complete to perform a Level II DQE for United States Environmental Protection Agency (USEPA) Methods SW6010D, SW6020B, SW7470A, EPA 300.0, SM 2320B and SM 2540C.

Sample Integrity

The groundwater samples were submitted to Pace Analytical Services, Inc. (Pace) in Peachtree Corners, Georgia and analyzed for CCR Appendix III metals and State D&O Permit metals by Method 6010D and 6020B, mercury by Method SW7470A, anions (chloride, fluoride, and sulfate) by Method 300.0, alkalinity by Method SW 2320B and total dissolved solids (TDS) by Method SM 2540C.

Based on the information provided on the Chain-of-Custody (COC) forms, the field samples arrived at the laboratory intact and within the temperature range and preservation requirements. Completed COC documents are included in the data package.

Sample Identification

This SDG contains the following groundwater and quality control (QC) samples:

Sample ID	Sample Date	DQE Level	Sample ID	Sample Date	DQE Level
GWC-16R	01/28/22	II	GWA-53	01/26/22	II
GWC-17R	01/28/22	II	GWA-53R	01/26/22	II
GWC-18	01/28/22	II	GWA-54	01/25/22	II
GWC-18R	01/27/22	II	GWA-55	01/26/22	II
GWC-19R	01/27/22	II	GWA-55R	01/27/22	II
GWC-20R	01/27/22	II	GWA-56	01/26/22	II
GWC-21R	01/28/22	II	<u>QA/QC Samples:</u>		
GWC-22R	01/27/22	II	EB-1	01/26/22	II
GWC-23R	01/28/22	II	FB-1*	01/25/22	II
GWC-24R	01/28/22	II	FB-2	01/26/22	II
GWC-25R	01/27/22	II	FB-3*	01/27/22	II
GWA-36RA	01/26/22	II	FB-4*	01/28/22	II
GWA-37	01/26/22	II	Dup-1	01/26/22	II
GWA-38	01/25/22	II	Dup-2	01/27/22	II
GWA-51RZ	01/26/22	II	Dup-3	01/28/22	II
GWA-52	01/25/22	II			

The samples reported in this SDG were collected from Landfill Cells 3&4 on January 25 through January 28, 2022. Sample Dup-1 is the field duplicate sample of GWA-55, Dup-2 is the field duplicate sample of GWC-18R, and Dup-3 is the field duplicate sample of GWC-24R. One field blank per day was collected, and one equipment blank was collected on the equipment used to sample the locations at Landfill Cells 3&4. *Sample IDs were modified per the GPC requested nomenclature for field blank samples FBL-1, FBL-3, and FBL-4 to FB-1, FB-3, and FB-4.

The analytical results for the metals, anions, alkalinity, and TDS data are usable with the qualifications discussed in this narrative. A summary of the data quality is presented below.

Metals (SW6010D/SW6020B/SW7470A)

The samples were submitted to Pace for CCR Appendix III and State D&O Permit metals by Method SW6010D, SW6020B, and/or mercury by SW7470A. The CCR Appendix III metals are: boron (B) and calcium (Ca). The State D&O Permit metals are: antimony (Sb), arsenic (As), barium (Ba), beryllium (Be), cadmium (Cd), chromium (Cr), cobalt (Co), copper (Cu), lead (Pb), mercury (Hg), nickel (Ni), selenium (Se), silver (Ag), thallium (Tl), vanadium (V), and zinc (Zn). Each of the Level II components were within QC limits except for MS/MSD recoveries and method and field blank contamination.

Holding Times

The sample analyses were performed within the 6 month and 28-day (for mercury) analysis holding times.

Method Blanks

One of the method blanks associated with samples in this SDG reported antimony between the reporting limit (RL) and the method detection limit (MDL). Results less than ten times the method blank are considered "not detected" as a possible laboratory artifact: **Reason Code: BL.**

Action: The antimony results for samples GWC-21R and DUP-2 were qualified as not detected due to laboratory blank contamination and flagged "U".*

Laboratory Control Samples (LCSs)

Percent recoveries for target analytes were within quality control limits in the LCSs.

Matrix Spike/Matrix Spike Duplicates (MS/MSDs)

MS/MSD analyses were performed for metals on samples GWA-38, GWA-52, GWA-55, GWC-16R, and GWC-18R and the recoveries and RPDs were within QC limits except for MS/MSD recoveries of Ca and Mg in sample GWC-18R.

Action: No qualification was necessary because the sample results were more than 4 times greater than the spike concentration.

Field Duplicate Precision

Three field duplicate pairs were submitted with this SDG and the RPDs were within QC limits.

Sampling Accuracy (Equipment Rinsate Blanks, Field Blanks)

Field accuracy was measured through the collection of equipment/rinsate blanks and field blanks. Equipment rinsate blanks are collected to monitor the decontamination process and field blanks are collected to assess the water used to decontaminate the equipment and the containers into which samples are placed. The equipment blank sample submitted in this SDG did not contain metals, and no results were considered possible field artifacts. One or more of the field blanks contained the following analytes: arsenic. Results less than ten times the field blank are considered "not detected" as a possible field artifact: **Reason Code: BF.**

Action: The positive arsenic results less than ten times the field blanks were qualified as not detected due to possible field blank contamination and flagged "U".*

Reporting Limits

The laboratory RLs were below the screening values for samples submitted for the analysis of metals by USEPA Method SW6010D, SW6020B and 7470A. Additionally, data are evaluated down to the MDL and results reported between the MDL and RL are considered quantitative estimates. Results reported between the MDL and RL were qualified as estimated and flagged "J" by the laboratory. The "J" qualifier was retained by the data validator.

Total and Dissolved Metals Comparison

If total and dissolved metals samples were collected, comparison of the total and dissolved results can aid in the representativeness of the total metals value versus the metals that may be associated with suspended solids and metals actually dissolved within the water column. The dissolved metals results should be less than or equal to the total metals concentration for positive results greater than 5 times the RL. No dissolved samples were collected and reported in this SDG.

Anions (EPA 300)

The samples were submitted to Pace for anions (chloride, fluoride, and sulfate) by Method 300.0, and each of the Level II components were within QC limits.

Holding Times

The sample analyses were performed within the 28-day analysis holding times.

Method Blanks

The method blank associated with the samples analyzed within this SDG did not contain anions indicating the analytical system was contaminant free during analysis.

Laboratory Control Samples (LCSs)

Percent recoveries for target analytes were within quality control limits in the LCSs.

Matrix Spike/Matrix Spike Duplicates (MS/MSDs)

An MS/MSD analysis was performed on samples GWA-53R and FB-4 and recoveries and RPDs were within QC limits.

Field Duplicate Precision

Three field duplicate pairs were submitted with this SDG and the RPDs were within QC limits.

Sampling Accuracy (Equipment Rinsate Blanks, Field Blanks)

The equipment blank and field blank samples submitted in this SDG did not contain anions, and no results were considered possible field artifacts.

Reporting Limits

The laboratory RLs were below the screening values for samples submitted for the analysis of anions by USEPA Method 300. One sample, GWC-23R, was diluted for sulfate (2x) to place the concentration within the calibration range. Additionally, data are evaluated down to the MDL and results reported between the MDL and RL are considered quantitative estimates. Results reported between the MDL and RL were qualified as estimated and flagged "J" by the laboratory. The "J" qualifier was retained by the data validator.

Alkalinity (SM 2320B)

The samples were submitted to Pace for alkalinity (total alkalinity, bicarbonate alkalinity, and carbonate alkalinity) by Method SM 2320B. Each of the Level II components were within QC limits.

Holding Times

The sample analyses were performed within the analysis holding times.

Method Blanks

The method blank associated with the samples analyzed within this SDG did not contain alkalinity.

Laboratory Control Samples (LCSs)

Percent recoveries for target analytes were within quality control limits in the LCSs.

Matrix Spike/Matrix Spike Duplicates (MS/MSDs)

An MS/MSD analysis was performed on samples GWA-52 and recoveries and RPDs were within QC limits.

Field Duplicate Precision

Three field duplicate pairs were submitted with this SDG and the RPDs were within QC limits.

Laboratory Duplicate Precision

Laboratory duplicates were not analyzed for any project samples in this SDG.

Sampling Accuracy (Equipment Rinsate Blanks, Field Blanks)

The equipment blank and field blanks associated with the samples in this SDG did not contain alkalinity.

Reporting Limits

The laboratory RL was below the screening value of 500 mg/L for samples submitted for the analysis of alkalinity by Method SM 2320B and no samples required dilutions; therefore, RLs were met for this project. Additionally, data are evaluated down to the MDL and results reported between the MDL and RL are considered quantitative estimates. Results reported between the MDL and RL were qualified as estimated and flagged "J" by the laboratory. The "J" qualifier was retained by the data validator.

TDS (SM 2540C)

The samples were submitted to Pace for TDS by Method SM 2540C. Each of the Level II components were within QC limits.

Holding Times

The sample analyses were performed within the 7-day analysis holding times.

Method Blanks

The method blank associated with the samples analyzed within this SDG did not contain TDS.

Laboratory Control Samples (LCSs)

Percent recoveries for target analytes were within quality control limits in the LCSs.

Field Duplicate Precision

Three field duplicate pairs were submitted with this SDG and the RPDs were within QC limits.

Laboratory Duplicate Precision

Laboratory duplicates were analyzed for TDS on samples EB-1 and GWC-25R and the RPDs were within QC limits.

Sampling Accuracy (Equipment Rinsate Blanks, Field Blanks)

The equipment blank and field blanks associated with the samples in this SDG did not contain TDS.

Reporting Limits

The laboratory RL was below the screening value of 500 mg/L for samples submitted for the analysis of TDS by Method SM 2540C and no samples required dilutions; therefore, RLs were met for this project. Additionally, data are evaluated down to the MDL and results reported between the MDL and RL are considered quantitative estimates. Results reported between the MDL and RL were qualified as estimated and flagged "J" by the laboratory, however no TDS results were reported between the MDL and RL.

Overall Site Evaluation and Professional Judgment Flagging Changes

The chemical data included in this SDG was validated in general accordance with the guidelines contained in the project work plan and validation SOPs. Professional judgment was not used to modify flags for results reported in samples presented in this SDG.

Completeness

A total of 22 wells, along with the required QC samples, were sampled and analyzed during the January event in Landfill Cells 3&4 according to the FSP (Amec Foster Wheeler, 2017). Each of the 22 well locations reported in this SDG were sampled and analyzed as scoped. However, well GWA-36 was scoped but was not sampled because the turbidity was high and the well could not be successfully re-developed. Additionally, surface water sample SS-1 was scoped but could not be sampled because of insufficient volume of water.

Therefore, field completeness is 94% (planned verses actual samples collected) and analytical completeness calculated for this SDG was 100%.

Laboratory Qualifiers:

B = Analyte detected in the associated method blank.

J = Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

Reason Codes:

BF = Field blank contamination. The result should be considered "not-detected".

BL = Laboratory blank contamination. The result should be considered "not-detected".

-- = No Reason Code assigned for values detected between the method detection limit (MDL) and the reporting limit (RL);estimated quantitation.

Validation Qualifiers:

J = The compound was positively identified; however, the associated numerical value is an estimated concentration only. The associated numerical value is the approximate concentration of the analyte in the sample.

U* = This analyte should be considered "not-detected" because it was detected in an associated blank at a similar level.

Data Evaluation Narrative

**Project: Plant Bowen CCR Event # 18 Groundwater Detection Monitoring/
Semiannual State Design and Operation Permit Monitoring**

Wood Project Number: 6122160287.2103.****

Site: Landfill Cells 9 & 10 - Plant Bowen, Georgia

Matrix: Groundwater

Pace SDG No: 92585555

Introduction

A data quality evaluation (DQE) was performed on the laboratory data reported for the CCR Event # 18 Groundwater Detection Monitoring Sampling Event and the Semiannual State Design and Operation (D&O) Permit sampling event conducted at Landfill Cells 9 & 10 at Plant Bowen, located in Cartersville, Georgia in January-February 2022. The samples were collected and analyzed per the protocols presented in the Plant Bowen *Field Sampling Plan* (FSP), Revision 1, Update 3 (Amec Foster Wheeler, 2017). The following sections provide summary discussions of the required data qualifications for the methods for samples collected. A Level II DQE validation was performed on the samples analyzed by the fixed-based laboratory within these sample delivery groups (SDGs). A Level II DQE consists of review of the following criteria: sample integrity, holding times, method blanks, laboratory control samples (LCSs), matrix spikes/matrix spike duplicate (MS/MSD) recoveries and relative percent differences (RPDs), post digestion spikes (PDS), where applicable, laboratory and field duplicate RPDs, field and/or equipment blanks, and reporting limits. Additionally, the data summary tables generated from the electronic data deliverable (EDD) were compared to the laboratory hardcopy data report to verify that the EDD and laboratory data report agree.

The data were reviewed using the laboratory's precision and accuracy limits, the method requirements, and any requirements listed in the FSP. It should be noted that at the time of this review, a finalized QAPP was not provided. DQE data qualifications were applied, if necessary, using the procedures in USEPA National Functional Guidelines for Inorganic Data Review (USEPA, 2020), as guidance, and professional judgment using the following qualifiers:

<u>Qualifier</u>	<u>Usable Data</u>
J	The analyte was positively identified but the result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample. <i>SCS Definition: Value J indicates the substance was detected at such low levels that the precision of the laboratory instruments could not produce as reliable of a value. Therefore, the value displayed (value J) is qualified by the laboratory as estimated.</i>
UJ	The analyte was analyzed for but was not detected above the level of the reported sample reporting/method detection limit. The reported method detection limit (MDL) is approximate and may be inaccurate or imprecise.
U	Analyte was analyzed for but was not detected above the level of the reported sample reporting/method detection limit. <i>Note: SCS does not use the "U" flag except when reporting results for radium that are detected below the Minimum Detection Concentration (MDC).</i>
U*	This analyte should be considered "not-detected" because it was detected in an associated blank at a similar level.

Qualifier Unusable Data

- R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet QC criteria. The presence or absence of the analyte cannot be confirmed.
- UR The analyte was analyzed for but was not detected above the level of the reported sample reporting or method detection; however, the data are unusable. The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The analyte may or may not be present in the sample.

The analytical results for the samples reported in this SDG are usable with the qualifications discussed in this narrative. A summary of the data with associated qualifiers is presented in **Table 1**.

Deliverables

The revised data package as submitted to Wood Environment & Infrastructure Solutions, Inc. (Wood, formerly Amec Foster Wheeler) is complete to perform a Level II DQE for United States Environmental Protection Agency (USEPA) Methods SW6010D, SW6020B, SW7470A, EPA 300.0, SM 2320B and SM 2540C.

Sample Integrity

The groundwater samples were submitted to Pace Analytical Services, Inc. (Pace) in Peachtree Corners, Georgia and analyzed for CCR Appendix III metals and State D&O Permit metals by Method 6010D and 6020B, mercury by Method SW7470A, anions (chloride, fluoride, and sulfate) by Method 300.0, alkalinity by Method SW 2320B and total dissolved solids (TDS) by Method SM 2540C.

Based on the information provided on the Chain-of-Custody (COC) forms, the field samples arrived at the laboratory intact and within the temperature range and preservation requirements. Completed COC documents are included in the data package.

Sample Identification

This SDG contains the following groundwater and quality control (QC) samples:

Sample ID	Sample Date	DQE Level	Sample ID	Sample Date	DQE Level
GWA-39RZ	02/02/22	II	GWC-47	02/01/22	II
GWA-39Z	01/31/22	II	GWC-47R	02/01/22	II
GWA-40	01/31/22	II	GWC-48	01/31/22	II
GWA-41	01/31/22	II	GWC-49R	02/01/22	II
GWA-41R	01/31/22	II	GWC-49Z	02/01/22	II
GWA-42	01/31/22	II	<u>QA/QC Samples:</u>		
GWA-43	01/31/22	II	EB-1	02/02/22	II
GWA-43R	01/31/22	II	FB-1	01/31/22	II
GWC-44	01/31/22	II	FB-2	02/01/22	II
GWC-45	02/01/22	II	FB-3	02/02/22	II
GWC-45R	02/01/22	II	DUP-1	01/31/22	II
GWC-46R	01/31/22	II	DUP-2	02/01/22	II

The samples reported in this SDG were collected from Landfill Cells 9&10 between January 31 through February 2, 2022. Sample DUP-1 is the field duplicate sample of GWA-41R and sample Dup-2 is the field

duplicate sample of GWC-45R. The equipment blank was collected on the equipment used to sample the locations at Landfill Cells 9&10, and one field blank was collected per day of sampling.

The analytical results for the metals, anions, alkalinity, and TDS data are usable with the qualifications discussed in this narrative. A summary of the data quality is presented below.

Metals (SW6010D/SW6020B/SW7470A)

The samples were submitted to Pace for CCR Appendix III and State D&O Permit metals by Method SW6010D, SW6020B, and/or mercury by SW7470A. The CCR Appendix III metals are: boron (B) and calcium (Ca). The State D&O Permit metals are: antimony (Sb), arsenic (As), barium (Ba), beryllium (Be), cadmium (Cd), chromium (Cr), cobalt (Co), copper (Cu), lead (Pb), mercury (Hg), nickel (Ni), selenium (Se), silver (Ag), thallium (Tl), vanadium (V), and zinc (Zn). Each of the Level II components were within QC limits except for method and field blank contamination and MS/MSD recoveries.

Holding Times

The sample analyses were performed within the 6 month and 28-day (for mercury) analysis holding times.

Method Blanks

One of the method blanks associated with the samples analyzed within this SDG reported a detection of As between the method detection limit (MDL) and the reporting limit (RL). Results less than ten times the field blank are considered "not detected" as a possible laboratory artifact: **Reason Code: BL**.

Action: The As results for sample DUP-1 were qualified as not detected due to possible method blank contamination and flagged "U".*

Laboratory Control Samples (LCSs)

Percent recoveries for target analytes were within quality control limits in the LCSs.

Matrix Spike/Matrix Spike Duplicates (MS/MSDs)

MS/MSD analyses were performed for metals on samples GWA-40, GWA-39Z, and DUP-1 from this SDG, and the recoveries and RPDs were within QC limits with the exception of the MS and MSD recoveries of magnesium and calcium in sample GWA-40. **Reason Code: M-**

Action: No qualification was required because the parent sample results of calcium and magnesium were greater than 4x the spike amount of the MS/MSD analysis.

Field Duplicate Precision

Two field duplicate pairs were submitted with this SDG and the RPDs were within QC limits.

Sampling Accuracy (Equipment Rinsate Blanks, Field Blanks)

Field accuracy was measured through the collection of equipment/rinsate blanks and field blanks. Equipment rinsate blanks are collected to monitor the decontamination process and field blanks are collected to assess the water used to decontaminate the equipment and the containers into which samples are placed. The equipment blank sample did not contain metals, and no results were considered possible field artifacts. One of the field blanks, FB-1, contained Sb between the MDL and the RL. FB-3 contained Cr between the MDL and RL. Results less than ten times the field blank are considered "not detected" as a possible field artifact: **Reason Code: BF**.

Action: The Cr results for sample GWA-39RZ and the Sb results for samples GWA-40 and GWA-41R were qualified as not detected due to possible field blank contamination and flagged "U".*

Reporting Limits

The laboratory RLs were below the screening values for samples submitted for the analysis of metals by USEPA Method SW6010D, SW6020B and 7470A. Additionally, data are evaluated down to the MDL and results reported between the MDL and RL are considered quantitative estimates. Results reported between the MDL and RL were qualified as estimated and flagged "J" by the laboratory. The "J" qualifier was retained by the data validator.

Total and Dissolved Metals Comparison

If total and dissolved metals samples were collected, comparison of the total and dissolved results can aid in the representativeness of the total metals value versus the metals that may be associated with suspended solids and metals actually dissolved within the water column. The dissolved metals results should be less than or equal to the total metals concentration for positive results greater than 5 times the RL. No dissolved samples were collected and reported in this SDG.

Anions (EPA 300)

The samples were submitted to Pace for anions (chloride, fluoride, and sulfate) by Method 300.0, and each of the Level II components were within QC limits except for MS/MSD recoveries.

Holding Times

The sample analyses were performed within the 28-day analysis holding times.

Method Blanks

The method blank associated with the samples analyzed within this SDG did not contain anions indicating the analytical system was contaminant free during analysis.

Laboratory Control Samples (LCSs)

Percent recoveries for target analytes were within quality control limits in the LCSs.

Matrix Spike/Matrix Spike Duplicates (MS/MSDs)

MS/MSD analyses were performed for anions on samples GWC-48 and GWC-45R, and the recoveries and RPDs were within QC limits with the exception of MS and MSD recoveries of chloride, fluoride, and sulfate in sample GWC-45R: **Reason Code: M+**.

Action: The chloride and sulfate results in sample GWC 45R and its field duplicate, DUP-2, were qualified as estimated and flagged "J". The fluoride results were not qualified because the exceedances were biased high, and the fluoride was not detected in the sample. High bias only affects positive results.

Field Duplicate Precision

Two field duplicate pairs were submitted with this SDG and the RPDs were within QC limits.

Sampling Accuracy (Equipment Rinsate Blanks, Field Blanks)

The equipment blank and field blanks associated with the samples of this SDG did not contain anions.

Reporting Limits

The laboratory RLs were below the screening values for samples submitted for the analysis of anions by USEPA Method 300. Additionally, data are evaluated down to the MDL and results reported between the MDL and RL are considered quantitative estimates. Results reported between the MDL and RL were qualified as estimated and flagged "J" by the laboratory. The "J" qualifier was retained by the data validator.

Alkalinity (SM 2320B)

The samples were submitted to Pace for alkalinity (total alkalinity, bicarbonate alkalinity, and carbonate alkalinity) by Method SM 2320B. Each of the Level II components were within QC limits.

Holding Times

The sample analyses were performed within the analysis holding times.

Method Blanks

The method blank associated with the samples analyzed within this SDG did not contain alkalinity.

Laboratory Control Samples (LCSs)

Percent recoveries for target analytes were within quality control limits in the LCSs.

Matrix Spike/Matrix Spike Duplicates (MS/MSDs)

An MS/MSD analysis was performed on samples GWA-40, GWC-48, and GWC-47R and recoveries and RPDs were within QC limits.

Field Duplicate Precision

Three field duplicate pairs were submitted with this SDG and the RPDs were within QC limits.

Laboratory Duplicate Precision

Laboratory duplicates were not analyzed for any project samples in this SDG.

Sampling Accuracy (Equipment Rinsate Blanks, Field Blanks)

The equipment blank and field blanks associated with the samples in this SDG did not contain alkalinity.

Reporting Limits

The laboratory RL was below the screening value of 500 mg/L for samples submitted for the analysis of alkalinity by Method SM 2320B and no samples required dilutions; therefore, RLs were met for this project. Additionally, data are evaluated down to the MDL and results reported between the MDL and RL are considered quantitative estimates. Results reported between the MDL and RL were qualified as estimated and flagged "J" by the laboratory. The "J" qualifier was retained by the data validator.

TDS (SM 2540C)

The samples were submitted to Pace for TDS by Method SM 2540C. Each of the Level II components were within QC limits.

Holding Times

The sample analyses were performed within the 7-day analysis holding times.

Method Blanks

The method blank associated with the samples analyzed within this SDG did not contain TDS.

Laboratory Control Samples (LCSs)

Percent recoveries for target analytes were within quality control limits in the LCSs.

Field Duplicate Precision

Two field duplicate pairs were submitted with this SDG and the RPDs were within QC limits.

Laboratory Duplicate Precision

Laboratory duplicates were analyzed for TDS on samples GWC-44 and DUP-2, and the RPDs were within QC limits.

Sampling Accuracy (Equipment Rinsate Blanks, Field Blanks)

The equipment blank and two of the field blanks associated with the samples in this SDG reported TDS; however, no qualification is applied for TDS in the field and equipment blanks.

Reporting Limits

The laboratory RL was below the screening value of 500 mg/L for samples submitted for the analysis of TDS by Method SM 2540C and no samples required dilutions; therefore, RLs were met for this project. Additionally, data are evaluated down to the MDL and results reported between the MDL and RL are considered quantitative estimates. Results reported between the MDL and RL were qualified as estimated and flagged “J” by the laboratory, however no TDS results were reported between the MDL and RL.

Overall Site Evaluation and Professional Judgment Flagging Changes

The chemical data included in this SDG was validated in general accordance with the guidelines contained in the project work plan and validation SOPs. Professional judgment was not used to modify flags for results reported in samples presented in this SDG.

Completeness

A total of 17 wells, along with the required QC samples, were sampled and analyzed during the August event in Landfill Cells 9&10 according to the FSP (Amec Foster Wheeler, 2017). Each of the 17 well locations were reported in this SDG and were sampled and analyzed as scoped.

Therefore, both field and analytical completeness calculated for this SDG was 100%.

Notes:

Laboratory Qualifiers:

B = Analyte was detected in the associated method blank.

J = Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

M1 = Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

Reason Codes:

BF = Field blank contamination. The result should be considered "not-detected".

BL = Laboratory blank contamination. The result should be considered "not-detected".

M+ = MS and MSD recoveries outside acceptance limits. The result may be biased high.

-- = No Reason Code assigned for values detected between the method detection limit (MDL) and the reporting limit (RL);estimated quantitation.

Validation Qualifiers:

J = The compound was positively identified; however, the associated numerical value is an estimated concentration only. The associated numerical value is the approximate concentration of the analyte in the sample.

U* = This analyte should be considered "not-detected" because it was detected in an associated blank at a similar level.

Data Evaluation Narrative

**Project: Plant Bowen CCR Event # 18 Groundwater Detection Monitoring/
Semiannual State Design and Operation Permit Monitoring**

Wood Project Number: 6122160287.2103.****

Site: Landfill Cells 1&2 - Plant Bowen, Georgia

Matrix: Groundwater

Pace SDG Nos: 92586436

Introduction

A data quality evaluation (DQE) was performed on the laboratory data reported for the CCR Event # 18 Groundwater Detection Monitoring Sampling and the Semiannual State Design and Operation (D&O) Permit sampling event conducted at Landfill Cells 1 & 2 at Plant Bowen, located in Cartersville, Georgia in February 2022 for Southern Company Services (SCS). The samples were collected and analyzed per the protocols presented in the Plant Bowen *Field Sampling Plan* (FSP), Revision 1, Update 3 (Amec Foster Wheeler, 2017). The following sections provide summary discussions of the required data qualifications for the analytical methods for samples collected. A Level II DQE validation was performed on the samples analyzed by the fixed-based laboratory within these sample delivery groups (SDGs). A Level II DQE consists of review of the following criteria: sample integrity, holding times, method blanks, laboratory control samples (LCSs), matrix spikes/matrix spike duplicate (MS/MSD) recoveries and relative percent differences (RPDs), post digestion spikes (PDS), where applicable, laboratory and field duplicate RPDs, field and/or equipment blanks, and reporting limits. Additionally, the data summary tables generated from the electronic data deliverable (EDD) were compared to the laboratory hardcopy data report to verify that the EDD and laboratory data report agree.

The data were reviewed using the laboratory’s precision and accuracy limits, the method requirements, and any requirements listed in the FSP. It should be noted that at the time of this review, a finalized QAPP was not provided. DQE data qualifications were applied, if necessary, using the procedures in USEPA National Functional Guidelines for Inorganic Data Review (USEPA, 2020), as guidance, and professional judgment using the following qualifiers:

<u>Qualifier</u>	<u>Usable Data</u>
J	The analyte was positively identified but the result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample. <i>SCS Definition: Value J indicates the substance was detected at such low levels that the precision of the laboratory instruments could not produce as reliable of a value. Therefore, the value displayed (value J) is qualified by the laboratory as estimated.</i>
UJ	The analyte was analyzed for but was not detected above the level of the reported sample reporting/method detection limit. The reported method detection limit is approximate and may be inaccurate or imprecise.
U	Analyte was analyzed for but was not detected above the level of the reported sample reporting/method detection limit. <i>Note: SCS does not use the “U” flag except when reporting results for radium that are detected below the Minimum Detection Concentration (MDC).</i>
U*	This analyte should be considered “not-detected” because it was detected in an associated blank at a similar level.

<u>Qualifier</u>	<u>Unusable Data</u>
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet QC criteria. The presence or absence of the analyte cannot be confirmed.
UR	The analyte was analyzed for but was not detected above the level of the reported sample reporting or method detection; however, the data are unusable. The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The analyte may or may not be present in the sample.

The analytical results for the samples reported in this SDG are usable with the qualifications discussed in this narrative. A summary of the data with associated qualifiers is presented in **Table 1**.

Deliverables

The data package as submitted to Wood Environment & Infrastructure Solutions, Inc. (Wood) is complete to perform a Level II DQE for United States Environmental Protection Agency (USEPA) Methods SW6010D, SW6020B, SW7470A, EPA 300.0, SM 2320B, and SM 2540C.

Sample Integrity

The groundwater samples were submitted to Pace Analytical Services, Inc. (Pace) in Peachtree Corners, Georgia and analyzed for CCR Appendix III metals and State D&O Permit metals by Methods SW6010D, SW6020B, and mercury by Method SW7470A, anions (chloride, fluoride, and sulfate) by Method 300.0, alkalinity by SM2320B, and total dissolved solids (TDS) by Method SM 2540C.

Based on the information provided on the Chain-of-Custody (COC) forms, the field samples arrived at the laboratory intact and within the temperature range and preservation requirements. Completed COC documents are included in the data package.

Sample Identification

This SDG contains the following groundwater and/or quality control (QC) samples:

Sample ID	Sample Date	DQE Level	Sample ID	Sample Date	DQE Level
GWA-1	02/01/22	II	GWC-11R	02/04/22	II
GWA-2	02/01/22	II	GWC-12	02/02/22	II
GWA-2R	02/01/22	II	GWC-13	02/17/22	II
GWA-3A	02/02/22	II	GWC-13RZ	02/04/22	II
GWA-4RZ	02/03/22	II	GWC-14Z	02/04/22	II
GWA-50	02/01/22	II	GWC-15R	02/04/22	II
GWA-50R	02/02/22	II	GWC-15Z	02/07/22	II
GWC-5	02/02/22	II	<u>QC Samples</u>		
GWC-6	02/02/22	II	FB-1	02/01/22	II
GWC-6RZ	02/02/22	II	FB-2	02/02/22	II
GWC-7Z	02/02/22	II	FB-3	02/03/22	II
GWC-8RR	02/02/22	II	FB-4	02/04/22	II
GWC-8Z	02/02/22	II	FB-5	02/07/22	II
GWC-9	02/02/22	II	FB-6	02/17/22	II
GWC-10	02/04/22	II	DUP-1	02/01/22	II
GWC-10R	02/04/22	II	DUP-2	02/02/22	II
GWC-11	02/04/22	II	DUP-3	02/04/22	II

These samples were collected from Landfill Cells 1&2 between February 1-4, 7 and 17, 2022. Sample DUP-1 is a field duplicate of sample GWA-2R, DUP-2 is a field duplicate of sample GWC-9, and DUP-3 is a field duplicate of sample GWC-11R. Samples FB-1 through FB-6 are field blanks. No equipment blanks are required for Landfill Cells 1&2 because each of the wells sampled have dedicated systems.

The analytical results for the metals, anions, and TDS data are usable with the qualifications discussed in this narrative. A summary of the data quality is presented below.

Metals (SW6010D/6020B/SW7470A)

The samples were submitted to Pace for CCR Appendix III and State D&O Permit metals by Method SW6010D, SW6020B and/or mercury by SW7470A. The CCR Appendix III metals are: boron (B) and calcium (Ca). The State D&O Permit metals are: antimony (Sb), arsenic (As), barium (Ba), beryllium (Be), cadmium (Cd), chromium (Cr), cobalt (Co), copper (Cu), lead (Pb), mercury (Hg), nickel (Ni), selenium (Se), silver (Ag), thallium (Tl), vanadium (V), and zinc (Zn). Each of the Level II components were within QC limits except for method and field blank contamination, and MS/MSD recoveries.

Holding Times

The sample analyses were performed within the 6-month and 28-day (for mercury) analysis holding times.

Method Blanks

One of the method blanks associated with the samples analyzed in this SDG contained a reportable concentration of arsenic between the method detection and reporting limits. Results less than ten times the field blank are considered "not detected" as a possible laboratory artifact. **Reason Code: BL:**

Action: The arsenic results for samples FB-4, FB-5, GWC-10, GWC-10R, GWC-11, GWC-11R, DUP-3, GWC-13RZ, GWC-14Z, GWC-15R, and GWC-15Z were qualified as not detected and flagged "U".*

Laboratory Control Sample (LCS)

Percent recoveries for target analytes were within quality control limits in the LCS.

Matrix Spike/Matrix Spike Duplicate (MS/MSD)

Batch MS/MSD analyses for metals were performed on samples GWA-2, GWA-4RZ, GWA-2R, GWC-10, and FB-5. The recoveries and RPDs were within QC limits except for calcium in samples GWA-2 and calcium and magnesium in sample GWA-4RZ. **Reason Code: M+**

Action: No qualification was necessary for calcium and magnesium because the parent sample results were greater than 4 times the spike amount.

Post Digestion Spike (PDS)

A PDS analysis was not available for review.

Field Duplicate Precision

Three field duplicate sample pairs were collected with this SDG, and the RPDs were within QC limits.

Sampling Accuracy (Equipment Rinsate Blanks, Field Blanks)

Field accuracy was measured through the collection of field blanks. Field blanks are collected to assess the water used to decontaminate the equipment and the containers into which samples are placed. No equipment blanks are required for LF Cells 1&2 because each of the wells sampled have dedicated systems. Two of the field blanks (FB-4 and FB-5) reported arsenic between the MDL and the RL. Results less than ten times the field blank are considered "not detected" as a possible field artifact. **Reason Code: BF:**

Action: No qualification was applied because the field blanks were qualified due to method blank contamination.

Reporting Limits

The laboratory RLs were below the screening values for samples submitted for the analysis of metals by USEPA Methods SW6010D, SW6020B and SW7470A.

Additionally, data are evaluated down to the MDL and results reported between the MDL and RL are considered quantitative estimates. Results reported between the MDL and RL were qualified as estimated and flagged "J" by the laboratory. The "J" qualifier is maintained by the data validator.

Total and Dissolved Metals Comparison

If total and dissolved metals samples were collected, comparison of the total and dissolved results can aid in the representativeness of the total metals value versus the metals that may be associated with suspended solids and metals actually dissolved within the water column. The dissolved metals results should be less than or equal to the total metals concentration for positive results greater than 5 times the RL. No dissolved samples were collected and reported in this SDG.

Anions (EPA 300.0)

The samples were submitted to Pace for anions (chloride, fluoride, and sulfate) by Method 300.0. Each of the Level II components were within the QC limits except for MS/MSD recoveries.

Holding Times

The sample analyses were performed within the 28-day analysis holding time.

Method Blanks

The method blank associated with the samples analyzed in this SDG contained no reportable detections of anions.

Laboratory Control Sample (LCS)

Percent recoveries for target analytes were within quality control limits in the LCSs.

Matrix Spike/Matrix Spike Duplicate (MS/MSD)

The batch MS/MSD for anions was performed on samples GWA-1, GWC-7Z, and GWC-11. The recoveries and RPDs were within QC limits except for low recoveries for chloride, fluoride, and sulfate in samples GWA-1 and GWC-7Z. **Reason Code: M+**

Action: The chloride and sulfate results for sample GWA-1 and GWC-7Z were qualified as estimated with an approximate reporting limit and flagged "J". No qualification was required for fluoride because fluoride was not detected in the sample; high bias only affects positive results.

Field Duplicate Precision

Three field duplicate sample pairs were collected with this SDG, and the RPDs were within QC limits.

Sampling Accuracy (Equipment Rinsate Blanks, Field Blanks)

Field accuracy was measured through the collection of field blanks. The field blanks did not contain positive results for anions.

Reporting Limits

The laboratory RLs were below the screening values for samples submitted for the analysis of anions by USEPA Method 300. Additionally, data are evaluated down to the MDL and results reported between the MDL and RL are considered quantitative estimates. Results reported between the MDL and RL were qualified as estimated and flagged "J" by the laboratory. The "J" qualifier is maintained by the data validator.

Alkalinity (SM 2320B)

The samples were submitted to Pace for alkalinity (total alkalinity, bicarbonate alkalinity, and carbonate alkalinity) by Method SM 2320B. Each of the Level II components were within QC limits.

Holding Times

The sample analyses were performed within the analysis holding times.

Method Blanks

The method blank associated with the samples analyzed within this SDG did not contain alkalinity.

Laboratory Control Samples (LCSs)

Percent recoveries for target analytes were within quality control limits in the LCSs.

Matrix Spike/Matrix Spike Duplicates (MS/MSDs)

An MS/MSD analysis was performed on samples GWC-8Z and recoveries and RPDs were within QC limits.

Field Duplicate Precision

Three field duplicate pairs were submitted with this SDG and the RPDs were within QC limits.

Laboratory Duplicate Precision

Laboratory duplicates were not analyzed for any project samples in this SDG.

Sampling Accuracy (Equipment Rinsate Blanks, Field Blanks)

The field blanks associated with the samples in this SDG did not contain alkalinity.

Reporting Limits

The laboratory RL was met for samples submitted for the analysis of alkalinity by Method SM 2320B and no samples required dilutions; therefore, RLs were met for this project. Additionally, data are evaluated down to the MDL and results reported between the MDL and RL are considered quantitative estimates. Results reported between the MDL and RL were qualified as estimated and flagged "J" by the laboratory. The "J" qualifier was retained by the data validator.

TDS (SM 2540C)

The samples were submitted to Pace for TDS by Method SM 2540C. Each of the Level II components were within the QC limits except for field duplicate precision.

Holding Times

The sample analyses were performed within the 7-day analysis holding times.

Method Blanks

The analytical method does not require the analysis of a method blank.

Laboratory Control Sample (LCS)

Percent recoveries for target analytes were within quality control limits in the LCS.

Field Duplicate Precision

Three field duplicate pairs were submitted with this SDG and one duplicate pair (GWC-9/DUP-2) was outside of the QC limits for TDS.

Action: The field duplicate pair (GWC-9/DUP-2) was qualified and flagged "J".

Laboratory Duplicate Precision

Laboratory duplicates were analyzed on project samples GWC-8RR and GWC-15R and the RPDs were within QC limits.

Sampling Accuracy (Equipment Rinsate Blanks, Field Blanks)

Field accuracy was measured through the collection of field blanks. One of the field blanks (FB-3) reported TDS above the RL. Results less than five times the field blank are considered “not detected” as a possible field artifact. **Reason Code: BF:**

Action: No qualification was applied because the associated samples were greater than five times the blank result.

Reporting Limits

The laboratory RL was below the screening value of 500 mg/L for samples submitted for the analysis of TDS by Method SM 2540C. Additionally, data are evaluated down to the MDL and results reported between the MDL and RL are considered quantitative estimates, however no TDS results were reported between the MDL and RL.

Overall Site Evaluation and Professional Judgment Flagging Changes

The chemical data included in this SDG was validated in general accordance with the guidelines contained in the project work plan and validation SOPs. No professional judgment was used to modify flags for results reported in samples presented in this SDG.

Completeness

A total of 24 wells, along with the required QC samples, were sampled and analyzed during the February 2022 event in Landfill Cells 1&2 according to the FSP (Amec Foster Wheeler, 2017). The 24 well locations along with field blank samples were reported in this SDG and were sampled and analyzed as scoped.

The field and analytical completeness were 100%. Therefore, the overall completeness was acceptable.

Laboratory Qualifiers:

B = Analyte detected in the associated method blank.
 J = Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.
 M1 = Matrix spike recovery exceeded QC limits. Batch accepted based on LCS recovery

Reason Codes:

BL = Laboratory blank contamination. The result should be considered "not-detected".
 FD = Field duplicate precision.
 M+ = MS and MSD recoveries outside acceptance limits. The result may be biased high.
 -- = No Reason Code assigned for values detected between the method detection limit (MDL) and the reporting limit (RL);estimated quantitation.

Validation Qualifiers:

J = The compound was positively identified; however, the associated numerical value is an estimated concentration only. The associated numerical value is the approximate concentration of
 U* = This analyte should be considered "not-detected" because it was detected in an associated blank at a similar level.

Data Evaluation Narrative

**Project: Plant Bowen Groundwater Detection Monitoring/
Semiannual State Design and Operation (D&O) Permit Monitoring**

Wood Project Number: 6122160287.2103.****

Site: Landfill Cells 3 & 4 - Plant Bowen, Georgia

Matrix: Groundwater

Pace SDG No: 92597519

Introduction

A data quality evaluation (DQE) was performed on the laboratory data reported for a new monitoring well installed at Landfill Cells 3 & 4 at Plant Bowen, located in Cartersville, Georgia in April 2022. The samples were collected and analyzed per the protocols presented in the Plant Bowen *Field Sampling Plan* (FSP), Revision 1, Update 3 (Amec Foster Wheeler, 2017). The following sections provide summary discussions of the required data qualifications for the methods for samples collected. A Level II DQE validation was performed on the samples analyzed by the fixed-based laboratory within these sample delivery groups (SDGs). A Level II DQE consists of review of the following criteria: sample integrity, holding times, method blanks, laboratory control samples (LCSs), matrix spikes/matrix spike duplicate (MS/MSD) recoveries and relative percent differences (RPDs), post digestion spikes (PDS), where applicable, laboratory and field duplicate RPDs, field and/or equipment blanks, and reporting limits. Additionally, the data summary tables generated from the electronic data deliverable (EDD) were compared to the laboratory hardcopy data report to verify that the EDD and laboratory data report agree.

The data were reviewed using the laboratory's precision and accuracy limits, the method requirements, and any requirements listed in the FSP. It should be noted that at the time of this review, a finalized QAPP was not provided. DQE data qualifications were applied, if necessary, using the procedures in USEPA National Functional Guidelines for Inorganic Data Review (USEPA, 2020), as guidance, and professional judgment using the following qualifiers:

<u>Qualifier</u>	<u>Usable Data</u>
J	The analyte was positively identified but the result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample. <i>SCS Definition: Value J indicates the substance was detected at such low levels that the precision of the laboratory instruments could not produce as reliable of a value. Therefore, the value displayed (value J) is qualified by the laboratory as estimated.</i>
UJ	The analyte was analyzed for but was not detected above the level of the reported sample reporting/method detection limit. The reported method detection limit is approximate and may be inaccurate or imprecise.
U	Analyte was analyzed for but was not detected above the level of the reported sample reporting/method detection limit. <i>Note: SCS does not use the "U" flag except when reporting results for radium that are detected below the Minimum Detection Concentration (MDC).</i>
U*	This analyte should be considered "not-detected" because it was detected in an associated blank at a similar level.

<u>Qualifier</u>	<u>Unusable Data</u>
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet QC criteria. The presence or absence of the analyte cannot be confirmed.
UR	The analyte was analyzed for but was not detected above the level of the reported sample reporting or method detection; however, the data are unusable. The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The analyte may or may not be present in the sample.

The analytical results for the samples reported in this SDG are usable with the qualifications discussed in this narrative. A summary of the data with associated qualifiers is presented in **Table 1**.

Deliverables

The data package as submitted to Wood Environment & Infrastructure Solutions, Inc. (Wood, formerly Amec Foster Wheeler) is complete to perform a Level II DQE for United States Environmental Protection Agency (USEPA) Methods SW6010D, SW6020B, SW7470A, EPA 300.0, SM 2320B and SM 2540C. No separate laboratory case narrative was included, however issues affecting the quality of the data were noted in the 'Analyte Qualifiers' section of the report.

Sample Integrity

The groundwater samples were submitted to Pace Analytical Services, Inc. (Pace) in Peachtree Corners, Georgia and analyzed for CCR Appendix III metals, State D&O Permit metals, and major ions by Method 6010D and 6020B, mercury by Method SW7470A, anions (chloride, fluoride, and sulfate) by Method 300.0, alkalinity by Method SW 2320B and total dissolved solids (TDS) by Method SM 2540C.

Based on the information provided on the Chain-of-Custody (COC) forms, the field samples arrived at the laboratory intact and within the temperature range and preservation requirements. Completed COC documents are included in the data package.

Sample Identification

This SDG contains the following groundwater and quality control (QC) samples:

Sample ID	Sample Date	DQE Level	QA/QC Samples	Sample Date	DQE Level
GWA-36A	04/06/22	II	FB-1	04/06/22	II

The samples reported in this SDG were collected from the new Landfill Cells 3&4 monitoring well on April 6, 2022. Sample FB-1 is the associated field blank. The analytical results for the metals, anions, alkalinity, and TDS data are usable with the qualifications discussed in this narrative. A summary of the data quality is presented below.

Metals (SW6010D/SW6020B/SW7470A)

The samples were submitted to Pace for CCR Appendix III, State D&O Permit metals, and major ions by Method SW6010D, SW6020B, and/or mercury by SW7470A. The CCR Appendix III metals are: boron (B) and calcium (Ca). The State D&O Permit metals are: antimony (Sb), arsenic (As), barium (Ba), beryllium (Be), cadmium (Cd), chromium (Cr), cobalt (Co), copper (Cu), lead (Pb), mercury (Hg), nickel (Ni), selenium (Se), silver (Ag), thallium (Tl), vanadium (V), and zinc (Zn). The major ions are: potassium (K), sodium (Na), and magnesium (Mg). Each of the Level II components were within QC limits except for MS/MSD recoveries and field blank contamination.

Holding Times

The sample analyses were performed within the 6 month and 28-day (for mercury) analysis holding times.

Method Blanks

The method blanks associated with samples in this SDG did not contain metals.

Laboratory Control Samples (LCSs)

Percent recoveries for target analytes were within quality control limits in the LCSs.

Matrix Spike/Matrix Spike Duplicates (MS/MSDs)

An MS/MSD analysis was performed for metals on sample GWA-36A and the recoveries of Ca and Mg were outside of QC limits.

Action: No qualification was necessary because the sample results were more than 4 times greater than the spike concentration.

Field Duplicate Precision

No field duplicate pairs were submitted with this SDG.

Sampling Accuracy (Equipment Rinsate Blanks, Field Blanks)

Field accuracy was measured through the collection of equipment/rinsate blanks and field blanks. Equipment rinsate blanks are collected to monitor the decontamination process and field blanks are collected to assess the water used to decontaminate the equipment and the containers into which samples are placed. No equipment blank was collected. The field blank contained Sb and As between the method detection limit (MDL) and the reporting limit (RL). Results less than ten times the field blank are considered "not detected" as a possible field artifact: **Reason Code: BF**.

Action: The arsenic result for sample GWA-36A was qualified as not detected due to possible field blank contamination and flagged "U".*

Reporting Limits

The laboratory RLs were below the screening values for samples submitted for the analysis of metals by USEPA Method SW6010D, SW6020B and 7470A. Additionally, data are evaluated down to the MDL and results reported between the MDL and RL are considered quantitative estimates. Results reported between the MDL and RL were qualified as estimated and flagged "J" by the laboratory. The "J" qualifier was retained by the data validator.

Total and Dissolved Metals Comparison

If total and dissolved metals samples were collected, comparison of the results can aid in the representativeness of the total metals value versus the metals that may be associated with suspended solids and metals actually dissolved within the water column. The dissolved metals results should be less than or equal to the total metals concentration for positive results greater than 5 times the RL. No dissolved samples were collected in this SDG.

Anions (EPA 300)

The samples were submitted to Pace for anions (chloride, fluoride, and sulfate) by Method 300.0, and each of the Level II components were within QC limits.

Holding Times

The sample analyses were performed within the 28-day analysis holding times.

Method Blanks

The method blank associated with the samples analyzed within this SDG did not contain anions indicating the analytical system was contaminant free during analysis.

Laboratory Control Samples (LCSs)

Percent recoveries for target analytes were within quality control limits in the LCSs.

Matrix Spike/Matrix Spike Duplicates (MS/MSDs)

An MS/MSD analysis was not performed on any sample from this SDG.

Field Duplicate Precision

No field duplicate pairs were submitted with this SDG.

Sampling Accuracy (Equipment Rinsate Blanks, Field Blanks)

The equipment blank and field blank samples submitted in this SDG did not contain anions, and no results were considered possible field artifacts.

Reporting Limits

The laboratory RLs were below the screening values for samples submitted for the analysis of anions by USEPA Method 300. Additionally, data are evaluated down to the MDL and results reported between the MDL and RL are considered quantitative estimates. Results reported between the MDL and RL were qualified as estimated and flagged "J" by the laboratory, however there were none in this SDG.

Alkalinity (SM 2320B)

The samples were submitted to Pace for alkalinity (total alkalinity, bicarbonate alkalinity, and carbonate alkalinity) by Method SM 2320B. Each of the Level II components were within QC limits.

Holding Times

The sample analyses were performed within the analysis holding times.

Method Blanks

The method blank associated with the samples analyzed within this SDG did not contain alkalinity.

Laboratory Control Samples (LCSs)

Percent recoveries for target analytes were within quality control limits in the LCSs.

Matrix Spike/Matrix Spike Duplicates (MS/MSDs)

An MS/MSD analysis was not performed on any sample from this SDG.

Field Duplicate Precision

No field duplicate pairs were submitted with this SDG.

Laboratory Duplicate Precision

Laboratory duplicates were not analyzed for any project samples in this SDG.

Sampling Accuracy (Equipment Rinsate Blanks, Field Blanks)

The field blank associated with the samples in this SDG did not contain alkalinity.

Reporting Limits

The laboratory RL was below the screening value of 500 mg/L for samples submitted for the analysis of alkalinity by Method SM 2320B and no samples required dilutions; therefore, RLs were met for this project. Additionally, data are evaluated down to the MDL and results reported between the MDL and RL are considered quantitative estimates. Results reported between the MDL and RL were qualified as estimated and flagged "J" by the laboratory, however there were none in this SDG.

TDS (SM 2540C)

The samples were submitted to Pace for TDS by Method SM 2540C. Each of the Level II components were within QC limits.

Holding Times

The sample analyses were performed within the 7-day analysis holding times.

Method Blanks

The method blank associated with the samples analyzed within this SDG did not contain TDS.

Laboratory Control Samples (LCSs)

Percent recoveries for target analytes were within quality control limits in the LCSs.

Field Duplicate Precision

No field duplicate pairs were submitted with this SDG.

Laboratory Duplicate Precision

Laboratory duplicates were not analyzed for any project samples in this SDG.

Sampling Accuracy (Equipment Rinsate Blanks, Field Blanks)

The field blank associated with the samples in this SDG did not contain TDS.

Reporting Limits

The laboratory RL was below the screening value of 500 mg/L for samples submitted for the analysis of TDS by Method SM 2540C and no samples required dilutions; therefore, RLs were met for this project. Additionally, data are evaluated down to the MDL and results reported between the MDL and RL are considered quantitative estimates. Results reported between the MDL and RL were qualified as estimated and flagged "J" by the laboratory, however no TDS results were reported between the MDL and RL.

Overall Site Evaluation and Professional Judgment Flagging Changes

The chemical data included in this SDG was validated in general accordance with the guidelines contained in the project work plan and validation SOPs. Professional judgment was not used to modify flags for results reported in samples presented in this SDG.

Completeness

A total of one well, along with the required QC sample, was sampled and analyzed during the April event in Landfill Cells 3&4 according to the FSP (Amec Foster Wheeler, 2017). The newly installed well location reported in this SDG was sampled and analyzed as scoped. Therefore, field and analytical completeness is 100% (planned verses actual samples collected).

FB-1	Field Blank	FB	92597519	6020B	arsenic	0.0016	J	J	--	mg/L

Laboratory Qualifiers:

J = Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit

Reason Codes:

BF = Field blank contamination, the result should be considered "not-detected"

-- = No Reason Code assigned for values detected between the method detection limit (MDL) and the reporting limit (RL);estimated quantitation

Validation Qualifiers:

J = The compound was positively identified; however, the associated numerical value is an estimated concentration only. The associated numerical value is the approximate concentration of the analyte in the sample.

U* = This analyte should be considered "not-detected" because it was detected in an associated blank at a similar level.

Samples

Sample ID:	Description:
------------	--------------

Low-Flow Test Report:

Test Date / Time: 1/25/2022 11:45:26 AM

Project: Plant Bowen LF January 2022

Operator Name: William Laaker

Location Name: GWA-36 Well Diameter: 2 in Casing Type: PVC Screen Length: 10 ft Top of Screen: 71.77 ft Total Depth: 81.77 ft Initial Depth to Water: 31.87 ft	Pump Type: QED Dedicated Tubing Type: LDPE Pump Intake From TOC: 76.77 ft Estimated Total Volume Pumped: 18180 ml Flow Cell Volume: 90 ml Final Flow Rate: 120 ml/min Final Draw Down: 0.11 ft	Instrument Used: Aqua TROLL 400 Serial Number: 789301
---	---	--

Test Notes:

Prepurged 2 L

At 24:00, lowered pump rate to 105 mL/min and at 44:00 raised pump rate to 120 mL/min to stabilize turb. Turb did not stabilize.

Will continue pumping 1/26.

Samples

Sample ID:	Description:
GWA-36RA	Metals, Inorganics, TDS, Alkalinity

Low-Flow Test Report:

Test Date / Time: 1/26/2022 11:53:05 AM

Project: Plant Bowen LF January 2022

Operator Name: William Laaker

Location Name: GWA-37 Well Diameter: 2 in Casing Type: PVC Screen Length: 10 ft Top of Screen: 97.52 ft Total Depth: 107.52 ft Initial Depth to Water: 49.64 ft	Pump Type: QED Dedicated Tubing Type: LDPE Pump Intake From TOC: 102.52 ft Estimated Total Volume Pumped: 10260 ml Flow Cell Volume: 90 ml Final Flow Rate: 105 ml/min Final Draw Down: 15.96 ft	Instrument Used: Aqua TROLL 400 Serial Number: 789301
--	---	--

Test Notes:

Prepurged 8 L

Prepurged at 300 mL/min to drawdown about 10 . At 20:00, lowered pump rate to 105 mL/min to stabilize drawdown. Pumped well for an additional hour after stabilization to attempt to bring into pH range, with no effect.

Low-Flow Test Report:

Test Date / Time: 2/1/2022 11:09:08 AM

Project: Plant Bowen LF January 2022

Operator Name: William Laaker

Location Name: GWC-49Z Well Diameter: 2 in Casing Type: PVC Screen Length: 10 ft Top of Screen: 85.2 ft Total Depth: 95.2 ft Initial Depth to Water: 54.56 ft	Pump Type: QED Dedicated Tubing Type: LDPE Pump Intake From TOC: 90.2 ft Estimated Total Volume Pumped: 8840 ml Flow Cell Volume: 90 ml Final Flow Rate: 130 ml/min Final Draw Down: 1.09 ft	Instrument Used: Aqua TROLL 400 Serial Number: 789301
--	---	--

Test Notes:

Prepurged 1 L

Fine black sediment in water. pH out of range, therefore pumped an hour to attempt to bring into range, with no effect.

Low-Flow Readings:

APPENDIX E STATISTICAL RESULTS

GROUNDWATER STATS CONSULTING

August 31, 2022

Southern Company Services
Attn: Mr. Joju Abraham
241 Ralph McGill Blvd. NE, Bin 10160
Atlanta, Georgia 30308-3374

Re: Plant Bowen Landfill Cells 1, 2, 9, and 10
Background Update and Statistical Analysis – February 2022 Sample Event

Dear Mr. Abraham,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the background update and statistical analysis of groundwater quality for the February 2022 sample event for Georgia Power Company's Plant Bowen Landfill Cells 1, 2, 9, and 10. The analysis complies with the United States Environmental Protection Agency (USEPA) Coal Combustion Residuals (CCR) Rule 40 Code of Federal Regulations (CFR) 257 Subpart D, the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10 and follows the USEPA Unified Guidance (2009).

Semi-annual sampling is conducted for USEPA's CCR Appendix III parameters, in addition to 16 parameters in accordance with the Georgia EPD's Solid Waste Permit. The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient wells:** GWA-1, GWA-2, GWA-2R, GWA-3A GWA-4RZ, GWA-39RZ, GWA-39Z, GWA-40, GWA-41, GWA-41R, GWA-42, GWA-43, GWA-43R, GWA-50R, and GWA-50
- **Downgradient wells:** GWC-5, GWC-6, GWC-6RZ, GWC-7Z, GWC-8RR, GWC-8Z, GWC-9, GWC-10, GWC-10R, GWC-11, GWC-11R, GWC-12, GWC-13, GWC-13RZ, GWC-14Z, GWC-15R, GWC-15Z, GWC-44, GWC-45, GWC-45R, GWC-46R, GWC-47, GWC-47R, GWC-48, GWC-49R, and GWC-49Z

Note that well GWA-3 was replaced with GWA-3A, which was first sampled in March 2021. As requested, data from well GWA-3 have been combined with data from replacement well GWA-3A.

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Dr. Jim Loftis, Civil & Environmental Engineering professor emeritus at Colorado State University and Senior Advisor to Groundwater Stats Consulting, and Kristina Rayner, Founder and Senior Statistician to Groundwater Stats Consulting. The analysis was prepared according to the recommended statistical methodology provided in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting and primary author of the USEPA Unified Guidance.

The following constituents are evaluated:

- **CCR Appendix III:** boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Georgia EPD Appendix I:** antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc

Note that the terms “parameters” and “constituents” are interchangeable throughout this report. When there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. A summary of well/constituent pairs with 100% non-detects follows this letter.

Time series plots for all well/constituent pairs are provided and are particularly useful for screening parameters detected in downgradient wells which require statistical analyses (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs.

Due to varying detection limits in background data sets, a substitution of the most recent reporting limit is used for all non-detects. Note that for calculation of intrawell prediction limits, substitution of the most recent reporting limit is performed separately for each well/parameter pair. In some cases, the reporting limit provided by the laboratory contains varying limits for a given parameter; therefore, the substitution may differ from well to well. This generally gives the most conservative limit in each case. For example, the historical reporting limit has been as low as 0.01 mg/L but is currently 0.02 mg/L. A single

reporting limit substitution is used across all wells in the time series plots for a given parameter since the wells are plotted as a group.

In earlier analyses, data at all wells for constituents detected in downgradient wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended. Power curves are provided to demonstrate that the selected statistical methods for the parameters listed above comply with the USEPA Unified Guidance and the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-.10. A few well/constituent pairs have a limited background data set with a minimum of 11 observations due either to sampling or truncation of background date ranges. As more samples are collected, these well/constituent pairs will meet the minimum power requirements. The EPA suggests the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations. Power curves were based on the following statistical methods:

Georgia EPD Appendix I Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan (antimony, arsenic, barium, cadmium, chromium, cobalt, copper, lead, nickel, selenium, silver, vanadium, and zinc)
- Interwell Prediction Limits with 1-of-2 resample plan (beryllium, mercury, and thallium)
- # Constituents: 16
- # Downgradient wells: 26

CCR Appendix III Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan – (boron, calcium, fluoride, sulfate, TDS)
- Interwell Prediction Limits with 1-of-2 resample plan – (chloride and pH)
- # Constituents: 7
- # Downgradient wells: 26

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. While the false positive rate

associated with the parametric limits is based on an annual 10% (5% per semi-annual event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits. Non-detects are handled as follows:

- No statistical analyses are required on wells and analytes containing 100% non-detects.
- When data contain <15% non-detects in background, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the interwell case, prediction limits are updated with upgradient well data during each event after careful screening for any new outliers. In the intrawell case, data for all wells and constituents may be re-evaluated when a minimum of 4 new data points are available to determine whether earlier concentrations are representative of present-day groundwater quality. In some cases, the earlier portion of data are deselected prior to construction of limits to provide sensitive limits that will rapidly detect changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

Two-Step Statistical Analysis

Intrawell statistical methods, combined with 1-of-2 resample plan, may be used as a conservative first step for identifying potential facility impacts in downgradient wells. Intrawell methods use background data for individual wells and may be overly sensitive to natural variation. In particular for nonparametric limits with small background sample

sizes, the probability of a false positive is higher than the desired annual sitewide rate of 10%. Therefore, a large number of exceedances may occur as a result of natural variation rather than facility impacts. A second step can be used to further evaluate those exceedances and reduce the overall number of SSIs that result from natural variation. In instances where intrawell statistical methods identify an apparent SSI, a second step of interwell statistical evaluation may be used to determine whether the measurement exceeds the sitewide background limit based on pooled upgradient well data. This is similar in concept to the procedure used in compliance monitoring programs where an interwell statistical limit is used to determine "background" (USEPA Unified Guidance (2009), Chapter 7, Section 7.5). For the detection monitoring program, if the result does not exceed sitewide (interwell) background, an SSI is not declared.

When the result exceeds the sitewide (interwell) background, the 1-of-2 resample plan allows for collection of an independent resample to confirm or disconfirm the initial finding. A statistically significant increase is not declared unless the resample exceeds the intrawell prediction limit (United State Environmental Protection Agency (USEPA) Unified Guidance, March 2009, Chapter 19). When the resample confirms the initial exceedance, further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). When any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. In cases where intrawell and interwell exceedances are noted and no resamples are collected, the initial exceedance will be considered a confirmed statistically significant increase (SSI).

Trend tests, in addition to interwell prediction limits, are recommended for well/constituent pairs found to have an apparent intrawell SSI. Trend analysis will provide for detection of long-term changes and potential facility impacts at a given well in cases where the concentrations at that well remain below the sitewide upgradient limits. Thus, the two-step approach has additional capability to detect long-term changes at downgradient wells compared to interwell methods alone. While a trend may be identified by visual inspection, a quantification of the trend and its significance is needed to identify whether concentrations are statistically significantly increasing, decreasing, or remaining stable over time. The absence of a statistically significant increasing trend indicates that an initial intrawell exceedance is short-term and may be the result of natural variation rather than facility impact to groundwater. If a facility impact has occurred, it will likely result in additional exceedances in future sampling events. When a statistically significant increasing trend is noted, additional data may be needed to demonstrate that there is reasonable evidence that the initial intrawell statistical exceedance is a result of natural variation rather than a result of impact to groundwater quality downgradient of the facility.

Appendix I & Appendix III Background Update – Conducted in April 2022

Outlier Analysis

Prior to updating background data, Tukey's outlier test and visual screening were used to evaluate data at all wells through February 2022. Tukey's test identified several potential outliers and confirmed previously flagged values (Figure C). Some identified values were not flagged because they appeared to be representative of natural variation. High values that were not identified by Tukey's test but flagged as outliers reduced variation among background datasets and resulted in statistical limits that are conservative (in most cases, lower) from a regulatory perspective. Note that previously flagged values for antimony at upgradient wells GWA-1 and GWA-2 along with downgradient well GWC-11R were unflagged during this analysis as more recent values were of similar concentration. As mentioned above, any flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages. Summary tables of all flagged values follow this report (Figure C).

Seasonality

No obvious seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made. When seasonal patterns are observed, data may be deseasonalized so that the resulting limits will correctly account for the seasonality as a predictable pattern rather than random variation or a release.

Determination of Spatial Variation

The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells for constituents detected in downgradient wells (Figure D). The ANOVA assists in identifying the most appropriate statistical approach. Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells are not representative of the current background data population; and when downgradient water quality is unimpacted compared to upgradient water quality for the same parameter.

The ANOVA identified variation for all Appendix I & III parameters except for mercury and thallium; therefore, mercury and thallium will be tested with interwell statistical methods. All parameters were further evaluated as described for the appropriateness of intrawell testing to accommodate the groundwater quality. A summary table of the ANOVA results is included with the reports.

Eligibility of Intrawell Methods

Intrawell limits constructed from carefully screened background data from within each well serve to provide statistical limits that are conservative (i.e., lower) from a regulatory perspective, and that will rapidly identify a change in more recent compliance data from within a given well. This statistical method removes the element of variation from across wells and eliminates the chance of mistaking natural spatial variation for a release from the facility. Prior to performing intrawell prediction limits, several steps are required to reasonably demonstrate downgradient water quality does not have existing impacts from the practices of the facility.

Exploratory data analysis was used as a general comparison of concentrations in downgradient wells for all Appendix I and III parameters recommended for intrawell analyses to concentrations reported in upgradient wells. Upper tolerance limits are used in conjunction with confidence intervals to determine whether the estimated averages in downgradient wells are higher than observed levels upgradient of the facility. Upper tolerance limits estimate an upper percentile (in this case the 99th percentile) with known confidence level and thus represent the upper range of likely background values. Tolerance limits are similar to prediction limits that are used for detection monitoring, but tolerance limits are constructed to contain a given fraction of the background population whereas prediction limits are constructed to contain a given number of future observations with known confidence level.

In cases where downgradient average concentrations are higher than observed concentrations upgradient for a given constituent, an independent study and hydrogeological investigation would be required to identify local geochemical conditions and expected groundwater quality for the region to justify an intrawell approach. Such an assessment is beyond the scope of services provided by Groundwater Stats Consulting. When there is not an obvious explanation for observed concentration differences in downgradient wells relative to reported concentrations in upgradient wells, interwell prediction limits will initially be selected for the statistical method until further evidence shows that concentrations are due to natural variation rather than a result of the facility.

Upper Tolerance Limits

Parametric tolerance limits were constructed with a target of 99% confidence and 95% coverage using pooled upgradient well data for each of the Appendix III parameters (Figure E). The confidence and coverage levels for nonparametric tolerance limits are dependent upon the number of background samples. As more data are collected, the background population is better represented and the confidence and coverage levels for nonparametric tolerance limits increase.

Confidence Intervals

Confidence intervals were constructed on downgradient wells for each of the Appendix I & III parameters, using the tolerance limits discussed above, to determine intrawell eligibility (Figure F). When the entire confidence interval is above a background standard for a given parameter, interwell methods are initially recommended as the statistical method. Therefore, only parameters with confidence intervals which did not exceed background standards are eligible for intrawell prediction limits. Note that well/constituent pairs with 100% non-detects were deselected prior to construction of confidence intervals, and a list of these well/constituent pairs follows this report.

Confidence intervals for Appendix I & III parameters exceeded their respective background limits for beryllium, chloride, and pH. Therefore, for Appendix I parameters, interwell methods are recommended for: beryllium, mercury, and thallium. Intrawell methods are recommended for antimony, arsenic, barium, cadmium, chromium, cobalt, copper, lead, nickel, selenium, silver, vanadium, and zinc. For Appendix III parameters, interwell methods are recommended for chloride and pH. Intrawell methods are recommended for boron, calcium, fluoride, sulfate, and TDS.

Mann-Whitney - Intrawell

For constituents requiring intrawell prediction limits, the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through September 2018 for Appendix I constituents and through September 2019 for Appendix III constituents to the medians of the new compliance samples at each well through August 2021 (Figures G and H, respectively). Previously truncated data sets discussed above were also compared to the most recent set of measurements through August 2021. If the medians of the two groups are not significantly different at the 99% confidence level, background data are typically updated to include the newer compliance data. Note that no reports were produced for several well/constituent pairs as there was no variation in the data. Additionally, no Mann-Whitney test was run for barium at downgradient well GWC-13RZ

since this well/constituent pair has been historically evaluated with a trend test in lieu of prediction limits due to due to steadily increasing data since early 2016.

Several statistically significant differences were found between the two groups for the Appendix I and III constituents. Typically, when the test concludes that the medians of the two groups are significantly different, particularly in the downgradient wells, the background data are not updated to include the newer data unless updating results in the same or more conservative limits, or it can be reasonably justified that the change in concentrations reflects a naturally occurring shift unrelated to practices at the site. In studies in which at least one of the segments being compared is of short duration, the comparison is complicated by the fact that normal short-term variation may be mistaken for long-term change in medians.

Statistically significant increasing medians were found for the following well/constituent pairs:

Appendix I:

- Barium: GWA-2R, GWA-4RZ (both upgradient), GWC-11R, and GWC-49R
- Cobalt: GWA-4RZ (upgradient)
- Zinc: GWC-47 and GWC-47R

Appendix III:

- Sulfate: GWC-14Z

These well/constituent pairs each had their respective records updated with compliance data and are discussed below.

For upgradient well/constituent pairs with significant increases in medians (barium in GWA-2R and GWA-4RZ and cobalt in GWA-4RZ), the increases in concentrations are, reportedly, not related to the facility and, therefore, represent background conditions. For barium in downgradient well GWC-11R and sulfate in downgradient well GWC-14Z, the concentrations are relatively low, and updating does not result in a high limit compared to upgradient wells. For barium in downgradient well GWC-49R, the compliance samples remain within range of concentrations upgradient of the facility and the pattern is very similar to that of upgradient well GWA-4RZ which has higher reported concentrations; therefore, this well/constituent pair was updated. Regarding zinc in downgradient wells GWC-47 and GWC-47R, the most recent concentrations in these wells are, reportedly, due to natural variation in groundwater quality, are somewhat similar to historical concentrations detected in these wells, are marginally higher than the current reporting

limit, and remain within the range of upgradient concentrations; therefore, these well/constituent pairs were updated.

A large number of well/constituent pairs for Appendix I and Appendix III constituents had statistically significant decreasing medians in more recent data. The significant cases are listed in the summary tables for Appendix I and Appendix III Mann-Whitney results. In most cases with significant results, the differences were relatively small, the most recent measurements were similar to measurements in the early part of the record, or the update resulted in the same or more conservative limits. Therefore, the majority of these records were updated. Except for pH, which has both an upper and lower prediction limit, decreasing differences will generally result in more conservative limits. For parametric limits, however, a decreasing difference can result in higher variance, which tends to increase the limit. For the following cases, earlier portions of the records were truncated to reduce variability among background data, utilize concentrations that appear to have stabilized, and remove elevated historical concentrations:

Appendix I:

- Vanadium: GWC-15Z
- Zinc: GWC-5

Appendix III:

- Calcium: GWC-49Z
- Sulfate: GWC-49Z

Any adjustments are shown in the Date Range Table in addition to adjustments listed for chromium, copper, and nickel from previous analysis.

Upgradient Well Trend Tests – Interwell

The Sen's Slope/Mann Kendall trend test was used to evaluate data at upgradient wells for each of the interwell parameters--beryllium, mercury, and thallium (Appendix I) and chloride and pH (Appendix III) to identify statistically significant increasing or decreasing trends in background (Figures I and J, respectively). The results of the trend analyses showed no statistically significant increasing or decreasing trends for Appendix I constituents. For the Appendix III constituents, no statistically significant increasing trends were identified. The following statistically significant decreasing trends were noted:

- Chloride: GWA-1, GWA-39Z, GWA-41, and GWA-41R
- pH: GWA-2R, GWA-41R, GWA-43, GWA-50, and GWA-50R

Truncation of upgradient well records to remove decreasing trends should be done with caution since the higher concentrations could appear in future years at downgradient wells in the absence of facility impacts. Therefore, no adjustments were made at this time. While no statistically significant trend was identified for pH in upgradient well GWA-3A, it was noted that the more recent reported measurements are higher than those reported historically. Concentrations of pH in this well will continue to be monitored and further studies may be required to determine the cause of the increasing concentrations.

Evaluation of Georgia EPD Appendix I Constituents – February 2022

Intrawell Prediction Limits

Intrawell prediction limits, combined with a 1-of-2 resample plan, for antimony, arsenic, barium, cadmium, chromium, cobalt, copper, lead, nickel, selenium, silver, vanadium, and zinc were constructed using all available data through August 2021, except for the cases mentioned above and listed in the Date Range Table (Figure K). Compliance data from the February 2022 sample event were compared to these limits. As previously discussed, no statistical analyses were included for well/constituent pairs with 100% non-detects.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. When a resample confirms the initial exceedance, a statistically significant increase (SSI) is identified, and further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). If any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. Exceedances were identified for the following well/constituent pairs:

- Barium: GWA-4RZ (upgradient) and GWC-45
- Cadmium: GWC-12

Additionally, the following well/constituent pairs were not identified as exceedances by the Sanitas software because the February 2022 observation is a non-detect.

- Zinc: GWA-42 (upgradient) and GWC-48

Exceedances in upgradient wells are an indication of natural changes in groundwater quality. Summaries of the Georgia EPD Appendix I prediction limits follow this report.

Two-Step Approach

When interwell prediction limits were constructed for the apparent intrawell prediction limit exceedances in downgradient wells, an exceedance was noted for cadmium in well GWC-12 (Figure L). Values that exceed intrawell background limits are further evaluated using trend tests as discussed below.

Interwell Prediction Limits

For beryllium, mercury, and thallium interwell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical upgradient well data through February 2022. Results and a summary table follow this report (Figure M). Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. The February 2022 sample from each downgradient well was compared to the background limit to determine whether exceedances over background are present. Exceedances were identified for the following downgradient well/constituent pairs:

- Beryllium: GWC-5
- Mercury: GWC-48

Trend Tests

When an exceedance occurs in a downgradient well, the exceedance is further evaluated using the Sen's Slope/Mann Kendall trend test--whether or not the exceedance is confirmed as an SSI--in addition to interwell prediction limits in accordance with the two-step analysis. Upgradient wells are included in the trend analyses to identify whether similar patterns exist upgradient of the site. As mentioned above, a trend test was included to evaluate concentrations for barium in well GWC-13RZ in lieu of prediction limits. That trend test, along with trend tests for upgradient wells, follows this report (Figure N). Statistically significant trends were identified for the following well/constituent pairs:

Increasing

- Barium: GWA-4RZ (upgradient) and GWC-13RZ

Decreasing

- Barium: GWA-1, GWA-3A, GWA-41, GWA-43, GWA-50, and GWA-50R (all upgradient)
- Cadmium: GWC-12

Note that for barium in downgradient well GWC-13RZ, although the trend test shows an overall increasing trend over the study period, there is a noted increase during 2016-17. Current concentrations appear to be stable since early 2018.

Evaluation of CCR Appendix III Parameters – February 2022

Intrawell Prediction Limits

For boron, calcium, fluoride, sulfate, and TDS, intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical data through August 2021. Results and a summary table follow this report (Figure O). The February 2022 sample from each downgradient well was compared to the background limit to determine whether exceedances over background are present. Exceedances were identified for the following well/constituent pairs:

- Calcium: GWA-3A (upgradient) and GWC-45
- Sulfate: GWC-45R
- TDS: GWA-3A (upgradient) and GWC-45

Two-Step Approach

When interwell prediction limits were constructed for the apparent intrawell prediction limit exceedances in downgradient wells, no exceedances were noted (Figure P). Therefore, the initial statistical exceedances are considered false positive results, and no further action is required. Note that the concentrations in downgradient wells at this site are small in absolute terms and are much smaller than those reported in the upgradient wells. Thus, very large increases at those wells would be required to exceed the interwell limits. In cases such as this, additional studies would be required to fully understand the groundwater quality. In addition to the two-step method, observations that exceeded intrawell background limits are further evaluated using trend tests as discussed below. If upward trends are found and persist, a separate geochemical and hydrologic investigation of the exceedances may be required to determine whether facility impacts have occurred.

Interwell Prediction Limits

For chloride and pH, interwell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical upgradient well data through February 2022. Results and a summary table follow this report (Figure Q). Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. The February 2022 sample from each downgradient well was compared to the background

limit to determine whether exceedances over background are present. Exceedances were identified for the following downgradient well/constituent pairs:

- Chloride: GWC-13RZ and GWC-48
- pH (upper limit): GWC-8RR and GWC-8Z
- pH (lower limit): GWC-9, GWC-44, GWC-45, GWC-48, and GWC-49Z

Trend Tests

Data from downgradient well/constituent pairs found to exceed their respective prediction limits were further evaluated using the Sen's Slope/Mann Kendall trend test along with upgradient wells for the same constituents (Figure R). A summary of the trend test results follows this letter. Statistically significant trends were identified for the following well/constituent pairs:

Increasing

- Calcium: GWA-42 (upgradient) and GWC-45R
- Chloride: GWC-48

Decreasing

- Calcium: GWA-43 (upgradient)
- Chloride: GWA-1, GWA-39Z, GWA-41, and GWA-41R (all upgradient)
- pH: GWA-2R, GWA-41R, GWA-43, GWA-50, GWA-50R (all upgradient), GWC-9, GWC-45, GWC-48, and GWC-49Z
- Sulfate: GWA-1, GWA-39Z, GWA-43, GWA-50, and GWA-50R (all upgradient)

Resample Reports – April 2022

Resamples were collected in April 2022 for the initial prediction limit exceedances of beryllium and pH in well GWC-5; cadmium and pH in well GWC-12; chloride, mercury, and pH in well GWC-48; and pH in well GWC-8Z. Time series and box plots were constructed for well/constituent pairs that were resampled, along with data from all upgradient wells for the same constituents (Figures S and T, respectively). An intrawell prediction limit was constructed to evaluate the resample using background data as discussed previously for cadmium (Figure U). No exceedance was identified for cadmium in well GWC-12; thus, the initial exceedance was not confirmed and no further action is necessary. Interwell prediction limits were constructed using pooled upgradient well data through February 2022 to evaluate the resamples for beryllium at well GWC-5 and mercury at well GWC-48 (Figure V). Exceedances were identified for both well/constituent pairs.

When interwell prediction limits were constructed using pooled upgradient well data through February 2022 to evaluate the resamples for chloride and pH, exceedances were identified for both constituents in well GWC-48 (Figure W). However, note that when the upper interwell prediction limit for chloride and the lower interwell prediction limit for pH are rounded to the same number of significant figures as the reported observations at well GWC-48, the limit and the observation are equal.

Summary

Georgia EPD Appendix I

Based on the results of the Appendix I prediction limits, the following apparent intrawell exceedances were identified:

Appendix I Intrawell

- Barium: GWA-4RZ (upgradient) and GWC-45
- Cadmium: GWC-12

Appendix I Interwell

- Beryllium: GWC-5
- Mercury: GWC-48

After testing the apparent intrawell exceedances using the two-step approach, an exceedance was identified for cadmium in well GWC-12.

CCR Appendix III

Based on the results of the Appendix I and III constituents requiring either intrawell or interwell prediction limits, the following apparent exceedances were identified:

Appendix III Intrawell

- Calcium: GWA-3A (upgradient) and GWC-45
- Sulfate: GWC-45R
- TDS: GWA-3A (upgradient) and GWC-45

Appendix III Interwell

- Chloride: GWC-13RZ and GWC-48
- pH (upper limit): GWC-8RR and GWC-8Z
- pH (lower limit): GWC-9, GWC-44, GWC-45, GWC-48, and GWC-49Z

After testing the apparent intrawell exceedances using the two-step approach, no exceedances were noted.

Trend tests were performed for all exceedances and corresponding upgradient wells. Results were presented in the corresponding tables.

Resample – April 2022

After resampling in April 2022 for beryllium and pH in well GWC-5; cadmium and pH in well GWC-12; chloride, mercury, and pH in well GWC-48; and pH in well GWC-8Z, exceedances were only identified for the following well/constituent pairs:

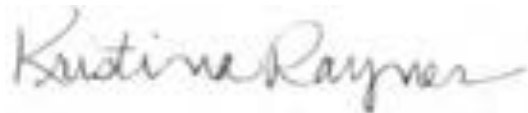

- Beryllium: GWC-5
- Chloride: GWC-48
- Mercury: GWC-48
- pH: GWC-48

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Plant Bowen Landfill Cells 1, 2, 9 and 10. If you have any questions or comments, please feel free to contact us.

 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Antimony Analysis Run 4/1/2022 5:06 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Antimony Analysis Run 4/1/2022 5:06 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Arsenic Analysis Run 4/1/2022 5:06 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Arsenic Analysis Run 4/1/2022 5:06 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Arsenic Analysis Run 4/1/2022 5:06 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Arsenic Analysis Run 4/1/2022 5:06 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Arsenic Analysis Run 4/1/2022 5:06 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Arsenic Analysis Run 4/1/2022 5:06 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Barium Analysis Run 4/1/2022 5:06 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Barium Analysis Run 4/1/2022 5:06 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Barium Analysis Run 4/1/2022 5:06 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Barium Analysis Run 4/1/2022 5:06 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Barium Analysis Run 4/1/2022 5:06 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Barium Analysis Run 4/1/2022 5:06 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Beryllium Analysis Run 4/1/2022 5:06 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Beryllium Analysis Run 4/1/2022 5:06 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Beryllium Analysis Run 4/1/2022 5:06 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Beryllium Analysis Run 4/1/2022 5:06 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Beryllium Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Beryllium Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Boron, total Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Boron, total Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Boron, total Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Boron, total Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Boron, total Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Boron, total Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Cadmium Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Cadmium Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Cadmium Analysis Run 4/1/2022 5:07 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Cadmium Analysis Run 4/1/2022 5:07 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Cadmium Analysis Run 4/1/2022 5:07 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Cadmium Analysis Run 4/1/2022 5:07 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Calcium, total Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Calcium, total Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Calcium, total Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Calcium, total Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Calcium, total Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Calcium, total Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Chloride, Total Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Chloride, Total Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Chloride, Total Analysis Run 4/1/2022 5:07 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Chloride, Total Analysis Run 4/1/2022 5:07 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Chloride, Total Analysis Run 4/1/2022 5:07 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Chloride, Total Analysis Run 4/1/2022 5:07 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Chromium Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Chromium Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Chromium Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Chromium Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Chromium Analysis Run 4/1/2022 5:07 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Chromium Analysis Run 4/1/2022 5:07 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Cobalt Analysis Run 4/1/2022 5:07 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Cobalt Analysis Run 4/1/2022 5:07 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Cobalt Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Cobalt Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Cobalt Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Cobalt Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Copper Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Copper Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Copper Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Copper Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Copper Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Copper Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Fluoride, total Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Fluoride, total Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Fluoride, total Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Fluoride, total Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Fluoride, total Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Fluoride, total Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Lead Analysis Run 4/1/2022 5:07 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Lead Analysis Run 4/1/2022 5:07 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Lead Analysis Run 4/1/2022 5:07 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Lead Analysis Run 4/1/2022 5:07 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Lead Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Lead Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Mercury Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Mercury Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Mercury Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Mercury Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Mercury Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Mercury Analysis Run 4/1/2022 5:07 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Nickel Analysis Run 4/1/2022 5:08 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Nickel Analysis Run 4/1/2022 5:08 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Nickel Analysis Run 4/1/2022 5:08 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Nickel Analysis Run 4/1/2022 5:08 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Nickel Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Nickel Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: pH Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: pH Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: pH Analysis Run 4/1/2022 5:08 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: pH Analysis Run 4/1/2022 5:08 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: pH Analysis Run 4/1/2022 5:08 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: pH Analysis Run 4/1/2022 5:08 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Seleniun Analysis Run 4/1/2022 5:08 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Seleniun Analysis Run 4/1/2022 5:08 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Seleniun Analysis Run 4/1/2022 5:08 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Seleniun Analysis Run 4/1/2022 5:08 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Selenium Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Selenium Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Silver Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Silver Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Silver Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Silver Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Silver Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Silver Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Sulfate, total Analysis Run 4/1/2022 5:08 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Sulfate, total Analysis Run 4/1/2022 5:08 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Sulfate, total Analysis Run 4/1/2022 5:08 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Sulfate, total Analysis Run 4/1/2022 5:08 PM
 Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Sulfate, total Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Sulfate, total Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Thallium Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Thallium Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Thallium Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Thallium Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Thallium Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Thallium Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Total Dissolved Solids [TDS] Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Total Dissolved Solids [TDS] Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Total Dissolved Solids [TDS] Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Total Dissolved Solids [TDS] Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Total Dissolved Solids [TDS] Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Total Dissolved Solids [TDS] Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Vanadium Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Vanadium Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Vanadium Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Vanadium Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Vanadium Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Vanadium Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Zinc Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Zinc Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Zinc Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Zinc Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Zinc Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Zinc Analysis Run 4/1/2022 5:08 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10

Time Series

Constituent: Antimony (mg/L) Analysis Run 4/1/2022 5:09 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, and 10
