Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 24 background values. 95.83% NDs. Well-constituent pair annual alpha = 0.006238. Individual comparison alpha = 0.003124 (1 of 2).

Constituent: Zinc Analysis Run 11/29/2022 4:56 PM View: Appendix I - Intrawell
Plant Scherer Client: Southern Company Data: Scherer Cell 1-CCR

Within Limit

Prediction Limit

Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 21 background values. 38.1% NDs. Well-constituent pair annual alpha = 0.007982. Individual comparison alpha = 0.003999 (1 of 2).

Exceeds Limit: GWC-4

Prediction Limit

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 99 background values. 2.02% NDs. Annual per-constituent alpha = 0.006628. Individual comparison alpha = 0.0001956 (1 of 2). Comparing 4 points to limit. Assumes 13 future values.

Constituent: Barium, Total Analysis Run 11/29/2022 5:06 PM View: Appendix I - Exceedances
 Plant Scherer Client: Southern Company Data: Scherer Cell 1-CCR

Exceeds Limit: GWC-10, GWC-9

Prediction Limit

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 83 background values. 84.34% NDs. Annual per-constituent alpha = 0.009352. Individual comparison alpha = 0.0002763 (1 of 2). Comparing 3 points to limit. Assumes 14 future values.

Exceeds Limit: GWC-10, GWC-20

Prediction Limit

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 57 background values. 98.25% NDs. Annual per-constituent alpha = 0.01922. Individual comparison alpha = 0.0005705 (1 of 2). Comparing 2 points to limit. Assumes 15 future values.

Constituent: Boron Analysis Run 12/13/2022 7:47 AM View: Appendix III - Exceedances
Plant Scherer Client: Southern Company Data: Scherer Cell 1-CCR

Exceeds Limit: GWC-19, GWC-4, GWC-9

Prediction Limit

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 57 background values. Annual per-constituent alpha = 0.01922. Individual comparison alpha = 0.0005705 (1 of 2). Comparing 3 points to limit. Assumes 14 future values.

Constituent: Calcium Analysis Run 12/13/2022 7:47 AM View: Appendix III - Exceedances
Plant Scherer Client: Southern Company Data: Scherer Cell 1-CCR

Within Limit

Prediction Limit

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 57 background values. Annual per-constituent alpha = 0.01922. Individual comparison alpha = 0.0005705 (1 of 2). Comparing 2 points to limit. Assumes 15 future values.

Constituent: Chloride Analysis Run 12/13/2022 7:47 AM View: Appendix III - Exceedances
Plant Scherer Client: Southern Company Data: Scherer Cell 1-CCR

Hollow symbols indicate censored values.

Exceeds Limit: GWC-10, GWC-4, GWC-9

Prediction Limit

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 57 background values. 73.68% NDs. Annual per-constituent alpha = 0.01922. Individual comparison alpha = 0.0005705 (1 of 2). Comparing 4 points to limit. Assumes 13 future values.

Constituent: Sulfate Analysis Run 12/13/2022 7:47 AM View: Appendix III - Exceedances
Plant Scherer Client: Southern Company Data: Scherer Cell 1-CCR

Exceeds Limit: GWC-4

Prediction Limit

Interwell Parametric

Background Data Summary: Mean=69.25, Std. Dev.=31.7, n=57, 3.509% NDs. Normality test: Shapiro Francia @alpha = 0.01, calculated = 0.9892, critical = 0.944. Kappa = 2.151 (c=7, w=17, 1 of 2, event alpha = 0.05132). Report alpha = 0.007498. Individual comparison alpha = 0.0004426. Comparing 2 points to limit. Assumes 15 future values.

Within Limit

Prediction Limit

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 99 background values. 96.97% NDs. Annual per-constituent alpha = 0.006628. Individual comparison alpha = 0.0001956 (1 of 2). Comparing 17 points to limit.

Constituent: Arsenic, Total Analysis Run 11/29/2022 5:01 PM View: Appendix I - Interwell
 Plant Scherer Client: Southern Company Data: Scherer Cell 1-CCR

Within Limit

Prediction Limit

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. All background values (n = 84) were censored; limit is most recent reporting limit. Annual per-constituent alpha = 0.009151. Individual comparison alpha = 0.0002703 (1 of 2). Comparing 3 points to limit. Assumes 14 future values.

Prediction Limit

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 99 background values. 2.02% NDs. Annual per-constituent alpha = 0.006628. Individual comparison alpha = 0.0001956 (1 of 2). Assumes 16 future values.

GROUNDWATER STATS CONSULTING

January 31, 2023

Southern Company Services
Attn: Mr. Joju Abraham
241 Ralph McGill Blvd NE, Bin 10160
Atlanta, Georgia 30308-3374

Re: Plant Scherer PAC Landfill
Statistical Analysis – August/November 2022

Dear Mr. Abraham,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the groundwater statistical analysis for the 2022 2nd Semi-Annual Groundwater Monitoring Statistical Analysis sample event for Georgia Power Company's Plant Scherer PAC Landfill. The analysis complies with the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10 and follows the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling began for the Coal Combustion Residuals (CCR) program in 2016. Semi-annual sampling for 16 parameters began in 2010 in accordance with the Georgia Department of Natural Resources, Environmental Protection Division (Georgia EPD) groundwater monitoring regulations. At least 8 background samples have been collected at each of the groundwater monitoring wells.

The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient wells:** GWA-21, GWA-22, GWA-45, GWA-46, GWA-47, GWA-48, and GWA-49
- **Downgradient wells:** GWC-29, GWC-50, GWC-51, GWC-52, and GWC-53

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Kristina Rayner, Founder and Senior Statistician to Groundwater Stats Consulting. The analysis is prepared according to the recommended statistical methodology prepared in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance.

Resamples were collected in November 2022 for TDS at wells GWA-45, GWA-46, GWA-47, GWA-48, GWA-49, GWC-29, GWC-50, GWC-51, GWC-52, and GWC-53 due to the August 2022 samples and October 2022 resamples being out of holding times. Per request of WSP, the samples that exceeded hold times for mercury and TDS are not included in the Sanitas database. Resamples were also collected for pH at these wells in October and November 2022 and were retained in the database.

The following constituents were evaluated:

- **CCR Appendix III** - boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Georgia EPD Appendix I** - antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc

Due to varying detection limits in data sets, generally due to improved laboratory practices, a substitution of the most recent reporting limit is used for all non-detects. Note that for calculation of intrawell prediction limits, substitution of the most recent reporting limit is performed separately for each well/parameter pair. In some cases, the reporting limit provided by the laboratory contained varying limits for a given parameter; therefore, the substitution may differ from well to well. This generally gives the most conservative limit in each case. However, in the time series plots, a single reporting limit substitution is used across all wells for a given parameter since the wells are plotted as a group.

Time series plots for CCR Appendix III and Georgia EPD Appendix I parameters at all wells are provided for the purpose of screening data at these wells (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs.

In earlier analyses, data at all wells for constituents detected in downgradient wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method

based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended. Power curves were provided during the background update in June 2021 and demonstrated that the selected statistical methods for the parameters listed above comply with the USEPA Unified Guidance and the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-.10. The EPA suggests that the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations. Power curves are based on the following:

Georgia EPD Appendix I Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan (arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, thallium, vanadium, and zinc)
- # Constituents: 14 (antimony and silver and were 100% non-detects in all downgradient wells)
- # Downgradient wells: 5

CCR Appendix III Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan (boron, calcium, chloride, fluoride, pH, sulfate, and TDS)
- # Constituents: 7
- # Downgradient wells: 5

Statistical analyses are not required when 100% non-detects are present in downgradient wells for a given constituent. Historically, reported observations for antimony and silver at all wells have been below the reporting limits; therefore, these constituents are not included in the statistical analyses. A summary of all other well/constituent pairs with 100% non-detects follows this letter.

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. While the false positive rate associated with the parametric limits is based on an annual 10% (5% for each semi-annual sample event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification resample plan.

The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits. Non-detects are handled as follows:

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the intrawell case, data for all wells and constituents may re-evaluated when a minimum of 4 new data points are available to determine whether earlier concentrations are representative of present-day groundwater quality. In some cases, an earlier portion of data is deselected prior to construction of limits to provide sensitive limits that will rapidly detect changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

Two-Step Statistical Analysis

Intrawell statistical methods, combined with a 1-of-2 resample plan, may be used as a conservative first step for identifying potential facility impacts in downgradient wells. Intrawell methods use background data for individual wells and may be overly sensitive to natural variation. In particular for nonparametric limits with small background sample sizes, the probability of a false positive is much higher than the desired annual sitewide rate of 10%. Therefore, a large number of exceedances may occur as a result of natural variation rather than facility impacts. A second step can be used to further evaluate those exceedances and reduce the overall number of statistically significant increases (SSI)s that result from natural variation. In instances where intrawell statistical methods identify an

apparent SSI, a second step of interwell statistical evaluation may be used to determine whether the measurement exceeds the sitewide background limit based on pooled upgradient well data. This is similar in concept to the procedure used in compliance monitoring programs where an interwell statistical limit is used to determine "background" (USEPA Unified Guidance (2009), Chapter 7, Section 7.5). For the detection monitoring program, if the result does not exceed sitewide (interwell) background, an SSI is not declared.

When the result exceeds the sitewide (interwell) background, the 1-of-2 resample plan allows for collection of an independent resample to confirm or disconfirm the initial finding. A statistically significant increase is not declared unless the resample also exceeds the intrawell prediction limit (United State Environmental Protection Agency (USEPA) Unified Guidance, March 2009, Chapter 19). When the resamples confirm the initial exceedance, further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). When any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. In cases where intrawell and interwell exceedances are noted and no resamples are collected, the initial exceedance will be considered a confirmed statistically significant increase.

Trend tests, in addition to interwell prediction limits, are recommended for well/constituent pairs found to have an initial intrawell SSI. Trend analysis will provide for detection of long-term changes and potential facility impacts at a given well in cases where the concentrations at that well remain below the sitewide upgradient limits. Thus, the two-step approach has additional capability to detect long-term changes at downgradient wells compared to interwell methods alone. While a trend may be identified by visual inspection, a quantification of the trend and its significance is needed to identify whether concentrations are statistically significantly increasing, decreasing, or remaining stable over time. The absence of a statistically significant increasing trend indicates that an initial intrawell exceedance is short-term and may be the result of natural variation rather than facility impact to groundwater. If a facility impact has occurred, it will likely result in additional exceedances in future sampling events. When a statistically significant increasing trend is noted, additional data may be needed to demonstrate that there is reasonable evidence that the initial intrawell statistical exceedance is a result of natural variation rather than a result of impact to groundwater quality downgradient of the facility.

Summary of Background Screening – CCR Appendix III – Conducted in 2017

The original background screening for Appendix III constituents was conducted in 2017 by MacStat Consulting. Values identified as outliers were flagged in the database and excluded prior to construction of statistical limits. Intrawell prediction limits, combined with a 1-of-2 resample plan, were recommended. The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells, which assists in identifying the most appropriate statistical approach.

Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells would not be conservative from a regulatory perspective; and when downgradient water quality is unimpacted compared to upgradient water quality for the same parameter. Based on the results of the original background screening, intrawell tests were recommended for all Appendix III parameters.

Summary of Background Screening Georgia EPD Appendix I - Conducted in August 2019

Outlier and Trend Testing

Time series plots were used to identify suspected outliers, or extreme values that would result in limits that are not representative of the current background data population. Suspected outliers at all wells and parameters are formally tested using Tukey's box plot method and, when identified, flagged in the computer database with "o" and deselected prior to construction of statistical limits. The results of Tukey's outlier test as well as a discussion of potential outliers and flagged values were included with the background screening report.

Seasonality

No obvious seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made to the data. When seasonal patterns are observed, data may be deseasonalized so that the resulting limits will correctly account for the seasonality as a predictable pattern rather than random variation or a release.

Trends

While trends may be identified by visual inspection, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test, which tests for statistically significant increasing or decreasing trends, was used to evaluate data at all upgradient wells and downgradient wells with detections.

In the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend and, thus, reduce variation in background. When statistically significant decreasing trends are present, all available data are evaluated to determine whether earlier concentration levels are significantly different from current reported concentrations and will be deselected as necessary. When any records of data are truncated for the reasons above, a summary report will be provided to show the date ranges used in construction of the statistical limits.

The results of the trend analyses showed several statistically significant increasing and decreasing trends; however, the majority of these were relatively low in magnitude when compared to average concentrations and, therefore, required no adjustments. It was noted that several of the upgradient wells had higher reported measurements in the earliest part of the records for some of the metals. These values were not deselected at this time since the measurements serve as reference data upgradient of the facility. If similar measurements are observed at a later time in one or more downgradient wells, the earlier upgradient data would indicate that the change is naturally occurring rather than a result of practices at the facility. Lastly, while there was an overall increasing trend in concentrations for cobalt at well GWC-53, data are highly variable and similar to concentrations that have historically been reported in at least one upgradient well. Therefore, no adjustment was made to this record. Since the August 2019 screening, the trend in cobalt at well GWC-53 has been decreasing.

Determination of Spatial Variation

The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells for constituents detected in downgradient wells. The ANOVA assists in identifying the most appropriate statistical approach.

Generally, constituents without significant differences, based on ANOVA across upgradient wells, may be considered for interwell analysis. However, the Scherer PAC Landfill is lined, and pre-waste data are available that show metals were present naturally in low level detections during the collection of background data. Furthermore, for some

constituents, the reported concentrations are higher in upgradient wells than in downgradient wells. This would result in interwell limits that would not readily detect changes in the downgradient wells with lower concentrations. Therefore, intrawell prediction limits are recommended as the most appropriate statistical analysis for all of the Georgia EPD constituents at this landfill.

Summary of Background Update – Georgia EPD Appendix I and CCR Appendix III – June 2021

Outlier Analysis

Prior to updating background data, visual screening was used to evaluate data for suspected outliers in upgradient and downgradient wells through September 2020 (Figure C). All of the more recent compliance measurements appeared stable compared to the previously screened historical data sets; therefore, no new outliers were flagged except for a resulting high value for lead in well GWC-52 in order to maintain conservative (i.e., lower) statistical limits. A summary of all flagged outliers follows this letter. Outliers are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages.

Mann-Whitney Comparison of Medians

For constituents requiring intrawell prediction limits (all Georgia EPD Appendix I and CCR Appendix III constituents in this instance), the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through October 2018 to the new compliance samples at each well through September 2020. When no variation is present between historical data and compliance samples, the Mann-Whitney test is not performed. A list of well/constituent pairs with no variation was included in the background update report. When the medians of the two groups are not statistically significantly different at the 99% confidence level, background data sets are updated to include the newer compliance data. The results of the Mann-Whitney test and discussion regarding updating background records were included with the background update report. A summary of well/constituent pairs using a truncated portion of their record to establish intrawell prediction limits follows this letter. All records for Appendix I and Appendix III constituents using intrawell methods will be re-evaluated during the next background update.

Statistical Analysis of Georgia EPD Appendix I Constituents – August/November 2022

Intrawell limits were constructed for all Georgia EPD Appendix I constituents. In cases where downgradient average concentrations are higher than observed upgradient concentrations for a given constituent, the current assumption is that the higher downgradient concentrations are due to natural spatial variation rather than a result of practices at the landfill. The pre-waste data support this logic.

For some well/constituent pairs containing <15% non-detects, parametric prediction limits slightly changed compared to those established during the background update. An update was made to the Sanitas™ statistical software in October 2022 that determines the percentage of non-detects within a given background record rather than all records evaluated for a given constituent. Simple substitution of 1/2 the reporting limit is applied when the percentage of non-detects is <15% in accordance with the USEPA EPA Unified Guidance (2009). No significant changes resulted from this implementation.

Prediction Limits

Intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all available data through September 2020 within each well for constituents with detections (Figure D). The August/November 2022 compliance samples were compared to these intrawell background limits. As previously discussed, no statistical analyses were included for antimony and silver since all records contain 100% non-detects in downgradient wells, or for other individual well/constituent pairs containing 100% non-detects. Note that due to a reporting limit change for nickel in upgradient wells GWA-21 and GWA-45 from 0.0018 mg/L to 0.001 mg/L; the prediction limit for each well decreased accordingly.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. When resamples confirm the initial exceedance, an SSI is identified, and further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). If a resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. A summary table of the background intrawell prediction limits and exceedances follows this letter, along with the complete graphical results. Statistical exceedances were noted for the following well/constituent pairs:

- Barium: GWA-45 (upgradient), GWC-29, GWC-50, and GWC-52

- Chromium: GWC-52
- Nickel GWA-21 (upgradient) and GWC-50

Two-Step Analysis

Following the two-step analysis procedure, interwell prediction limits were then constructed using pooled upgradient well data through November 2022 to evaluate the initial intrawell prediction limit exceedances listed above in downgradient wells (Figure E). Due to an increasing trend in the most recent data for barium at upgradient well GWA-45, observations between September 2019 and April 2021 in this well were not included in the interwell limit. The observations were flagged with an “L” flag and are included in the Outlier Summary which shows data that have been deselected (Figure C). The cause of this trend is pending and requires further analysis beyond the scope of this analysis. If research shows these higher concentrations reflect natural variation, the earlier portion of the record may require deselection so that resulting limits are reflective of present-day water quality conditions. The reported measurements of barium, chromium, and nickel at downgradient wells were within their respective interwell prediction limits. Therefore, no SSIs are identified for the Appendix I constituents, and no further action is necessary.

Trend Tests

When prediction limit exceedances occur in any of the downgradient wells, data are further evaluated using the Sen’s Slope/Mann Kendall trend test at the 99% confidence level to determine whether concentrations are significantly increasing, decreasing, or stable (Figure F). Upgradient wells are included in the trend analyses to identify whether similar patterns exist upgradient of the site. Upgradient trends are an indication of natural variability in groundwater unrelated to practices at the site. Both a summary and complete graphical results of the trend tests follow this letter. Statistically significant trends were noted for the following well/constituent pairs:

Increasing:

- Barium: GWA-45 (upgradient), GWA-46 (upgradient), GWC-29, GWC-50, and GWC-52
- Chromium: GWA-22 (upgradient) and GWC-52

Decreasing:

- Chromium: GWA-21 (upgradient)
- Nickel: GWA-48 (upgradient)

Note that while concentrations for chromium at well GWC-52 have been steadily increasing since October 2017, the measurements remain within historical concentrations observed at upgradient well GWA-47.

Statistical Analysis of Appendix III Parameters – August/November 2022

Intrawell prediction limits for all Appendix III parameters, combined with a 1-of-2 resample plan, were constructed using all historical data through September 2020. The August/November 2022 compliance data were compared to those limits.

Prediction Limits

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. If the resample falls within the statistical limit, the initial exceedance is considered to be a false positive result; therefore, no exceedance is noted, and no further action is necessary. If no resample is collected, the original result is considered a confirmed exceedance. A summary table of the Appendix III prediction limits follow this letter, along with complete graphical results (Figure G). The following prediction limit exceedances were noted for Appendix III parameters:

- Calcium: GWC-29 and GWC-52
- Chloride: GWA-45, GWA-46 (both upgradient), and GWC-51
- pH (upper limit): GWA-49 (upgradient) and GWC-29
- Sulfate: GWA-21, GWA-46, GWA-47 (all upgradient), and GWC-52

October & November 2022 Resample Event - pH

An additional set of intrawell prediction limits were constructed using data through September 2020 to evaluate the October and November 2022 resample observations for pH at upgradient wells GWA-45, GWA-46, GWA-47, GWA-48, GWA-49 and downgradient wells GWC-29, GWC-50, GWC-51, GWC-52, GWC-53 (Figures H and I, respectively). Exceedances were identified for the following well/constituent pair during both events:

- pH (upper limit): GWC-29

Two-Step Analysis

Following the two-step analysis procedure as mentioned above, interwell prediction limits were then constructed using pooled upgradient well data through November 2022 to

evaluate the apparent initial intrawell prediction limit exceedances listed above at downgradient wells (Figure J). All compliance data at downgradient wells were within their respective interwell prediction limits. Therefore, no statistically significant increases are identified, and no further action is necessary. It was noted that upgradient well GWA-45, which is included in the interwell background and represents naturally occurring groundwater quality upgradient of the site, has higher concentrations than neighboring upgradient wells for several of the Appendix III constituents. Therefore, the interwell comparisons for downgradient wells with reported lower concentration levels need to be interpreted cautiously and are further evaluated through trend analysis as described below.

Trend Tests

Data from downgradient well/constituent pairs found to exceed their respective prediction limit were further evaluated using the Sen's Slope/Mann Kendall trend test at the 99% confidence level along with upgradient wells for the same constituents (Figure I). Upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells to identify whether similar patterns exist upgradient of the site. Such patterns are an indication of natural variability in groundwater unrelated to practices at the site. A summary of the trend test results follows this letter. The following statistically significant trends were identified:

Increasing:

- Calcium: GWC-29 and GWC-52
- Chloride: GWA-21, GWA-45, GWA-46 (all upgradient), and GWC-51
- pH: GWC-29
- Sulfate: GWC-52

Decreasing:

- Chloride: GWA-22 (upgradient)

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Plant Scherer PAC Landfill. If you have any questions or comments, please feel free to contact us.

Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 22 background values. 36.36% NDs. Well-constituent pair annual alpha = 0.007401. Individual comparison alpha = 0.003707 (1 of 2).

Constituent: Copper, Total Analysis Run 12/1/2022 9:14 AM View: Appendix I - Intrawell
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Within Limit

Prediction Limit
Intrawell Non-parametric

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 215 background values. Annual per-constituent alpha = 0.0004919. Individual comparison alpha = 0.0000492 (1 of 2). Comparing 3 points to limit. Assumes 2 future values.

Constituent: Barium, Total Analysis Run 12/1/2022 9:29 AM View: Appendix I - Two-Step
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 222 background values. 18.92% NDs. Annual per-constituent alpha = 0.0004919. Individual comparison alpha = 0.0000492 (1 of 2). Assumes 4 future values.

Constituent: Chromium, Total Analysis Run 12/1/2022 9:29 AM View: Appendix I - Two-Step
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Hollow symbols indicate censored values.

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 186 background values. 77.42% NDs. Annual per-constituent alpha = 0.0005719. Individual comparison alpha = 0.00005721 (1 of 2). Assumes 4 future values.

GWA-22 (bg)

n = 26
Slope = 0 units per year.
Mann-Kendall statistic = -42
critical = -118
Trend not significant at 99% confidence level (α = 0.005 per tail).

Within Limits

Prediction Limit
Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 17 background values. Well-constituent pair annual alpha = 0.02359. Individual comparison alpha = 0.01183 (1 of 2).

Constituent: pH Analysis Run 12/2/2022 10:04 AM View: Appendix III - Intrawell Resample

Within Limits

Prediction Limit
Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 17 background values. Well-constituent pair annual alpha = 0.02359. Individual comparison alpha = 0.01183 (1 of 2).

Constituent: pH Analysis Run 12/2/2022 10:13 AM View: Appendix III - Intrawell Resample

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 133 background values. Annual per-constituent alpha = 0.00112. Individual comparison alpha = 0.0001121 (1 of 2). Comparing 2 points to limit. Assumes 3 future values.

Constituent: Calcium Analysis Run 12/1/2022 9:35 AM View: Appendix III - Two-Step
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 132 background values. Annual per-constituent alpha = 0.001138. Individual comparison alpha = 0.0001138 (1 of 2). Assumes 4 future values.

Constituent: Chloride Analysis Run 12/1/2022 9:35 AM View: Appendix III - Two-Step
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Within Limits

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 163 background values. Annual per-constituent alpha = 0.001483. Individual comparison alpha = 0.0001483 (1 of 2). Assumes 4 future values.

Constituent: pH Analysis Run 12/1/2022 9:35 AM View: Appendix III - Two-Step
Plant Scherer Client: Southern Company Data: Scherer PAC-CCR

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 133 background values. 42.86% NDs. Annual per-constituent alpha = 0.00112. Individual comparison alpha = 0.0001121 (1 of 2). Assumes 4 future values.

1.0 INTRODUCTION

This alternate source demonstration (ASD) has been prepared on behalf of Georgia Power Company (Georgia Power) by Golder Associates USA Inc., a member of WSP (Golder), in accordance with 40 CFR § 257.94(e)(2) of the Federal Coal Combustion Residuals (CCR) Rule and § 391-3-4-.14(23)(c) of the Georgia (GA) Solid Waste Management Rules to address the statistically significant increases (SSIs) of monitored constituents over background concentrations.

These SSIs were presented in the *2021 Annual Groundwater Monitoring & Corrective Action Report*, dated January 31, 2022, for the August 2021 semi-annual groundwater sampling event at Georgia Power's Plant Scherer (Scherer) Cell 1 and Powdered Activated Carbon (PAC) Ash cell (Golder, 2022). Within 90 days of the reported SSIs in compliance with 391-3-.14, this report describes an alternate source for the reported SSIs and demonstrates that the SSIs are not the result of a release from Cell 1 or PAC Ash Cell, but rather due to natural variability in groundwater chemistry.

Semi-annual groundwater quality monitoring and reporting for the landfill units at Plant Scherer are performed in accordance with the Solid Waste Permit 102-009D(LI); and the *Groundwater Monitoring Plan Narrative of the Design & Operations Plan for Georgia Power Company's, Plant Scherer CCB Disposal Facility*, prepared by Southern Company Generation Engineering and Construction Services, February 26, 2010 and the CCR Rule 40 CFR § 257.90-98. The following sections address the statistical exceedances noted following the 2021 second semi-annual monitoring event and provides evidence that demonstrates an alternate source for these exceedances.

2.0 SITE DESCRIPTION

Plant Scherer is a coal-fired power generation facility located in northeast Monroe County approximately 5 miles south of Juliette, GA. The property occupies approximately 13,000 acres and is bounded on the south by Lake Juliette. The plant is primarily surrounded by agricultural and residential use. Figure 1 depicts the location of Plant Scherer relative to the surrounding area.

The Plant Scherer Landfill consists of a two active cells, namely, Cell 1 and PAC Ash Cell. The two active cells have been utilized since 2011 for the disposal of CCR. Figure 2, depicts the general configuration of the landfill units and site monitoring wells along with the potentiometric surface from August 2021.

The site is located within the Piedmont Physiographic Province of central Georgia, which is characterized by gently rolling hills and narrow valleys, with locally pronounced linear ridges (Golder, 2021a). Overall, the property slopes gently south towards Lake Juliette and east toward the Ocmulgee River (Figure 1). The landfill is situated east/southeast of the ash pond which is in a topographically high area on the property. The landfill cells have a geosynthetic clay liner and a geomembrane, and a leachate collection and removal system.

3.0 EVALUATION OF ANALYTICAL RESULTS & STATISTICAL ANALYSES

As presented in the *2021 Annual Groundwater Monitoring & Corrective Action Report*, analytical results show that concentrations of target constituents are below the established prediction limits (PLs) in groundwater samples collected during the August 2021 sampling event with exception of nickel in GWC-2 and calcium in GWC-19. Table 1 presents a summary of the August 2021 monitoring results.

In lieu of immediate verification resampling, an ASD has been prepared to address the SSIs over background. Table 2 provides the results of the August 2021 sampling event, the upper PLs, and whether each statistical exceedance is verified from the previous (March/April 2021) event or an initial control limit exceedance. The SSI for calcium at well GWC-19 is a verified exceedance, whereas the SSI for nickel at well GWC-2 is an initial exceedance.

3.1 Statistical Analysis Method

The selected statistical method for Cell 1 and PAC Ash Cell was developed using methodology presented in *Statistical Analysis of Groundwater Data at RCRA Facilities, Unified Guidance*, March 2009, USEPA 530/R-09-007 (Unified Guidance). The Sanitas groundwater statistical software was used to perform the statistical analyses. Sanitas is a decision-support software package that incorporates the statistical tests required of Subtitle C and D facilities by United States Environmental Protection Agency (USEPA) regulations and guidance as recommended in the USEPA Unified Guidance (2009) document.

During detection monitoring at the site, groundwater quality data are evaluated using a two-step statistical approach (i.e., intrawell followed by interwell PLs). The statistical method(s) use an optional 1-of-2 verification resample plan. An initial exceedance occurs when any downgradient well data exceed both intra- and inter-well PLs.

4.0 ALTERNATE SOURCE DEMONSTRATION

In accordance with Rule and § 391-3-4-.14(23)(c) and 40 CFR § 257.94(e)(2), the following discussion provides a demonstration that the SSIs identified following the August 2021 sampling event are not the result of a release from Cell 1 or the PAC Ash Cell.

4.1 Calcium (GWC-19)

An ASD for calcium at GWC-19 was previously submitted (Golder, 2021b). The concentration of calcium at GWC-19 for the August 2021 event is similar to historical concentrations as shown in Figure 3; therefore, the previously submitted ASD is still applicable. Further, the calcium concentration at GWC-19 for the February 2022 sampling event is 15 mg/L, which is below the established PL of 15.99 mg/L. The variations in calcium in groundwater at GWC-19 are due to natural variations in groundwater quality related to mineral saturation and solubility.

4.2 Nickel (GWC-2)

A SSI of nickel was identified at downgradient Cell 1 monitoring well GWC-2 following the August 2021 sampling event. The reported concentration of nickel (0.0028 mg/L) was above the PL (0.0023 mg/L). However, the nickel concentration at GWC-2 during the February 2022 sampling event was 0.0018 mg/L, which is below the established PL of 0.0023 mg/L (see Appendix and Figure 4). As such, the verified SSI of nickel at GWC-2 was not confirmed following the February 2022 monitoring event.

The entire time series plot for nickel in well GWC-2 (Figure 4) shows that reported concentrations are stable over the last 12 years in the range 0.0017 to 0.0034 mg/L and are within the range of concentrations observed at other site monitoring wells (<0.00034 to 0.04 mg/L; Table 1). These data also show that the reported concentrations at GWC-2 are variable and are not part of a statistically significant trend (slope equals zero; Golder, 2022). The noted increase in nickel concentrations at GWC-2 corresponds with an increase in groundwater elevation (+10 feet as a result of recent significant rain events). The slight increase of nickel concentrations for the August 2021 sampling event is likely due to natural variability in groundwater quality.

The nickel concentration at GWC-2 is relatively low (within 0.0005 mg/L of the Upper Prediction Limit; Golder 2022) and is similar to those expected in the regolith – fractured bedrock aquifers in the Piedmont of southeastern US (USGS, 2013). Boron, a primary CCR indicator has not been detected above method detection limits at this well since monitoring was initiated in 2016 (Figure 5). Based on published data and site-specific data presented in this ASD, the observed concentration of nickel at GWC-2 is representative of naturally occurring and naturally variable nickel concentrations within Piedmont aquifers.

5.0 CONCLUSIONS

This ASD has been prepared in response to apparent statistical exceedances presented in the *2021 Annual Groundwater Monitoring & Corrective Action Report, Georgia Power Plant Scherer Cell 1 and PAC Ash Cell, Permit No. 102.009D(LI)*, dated January 31, 2021. In accordance with 40 CFR § 257.94(e)(2) and §391-3-4-.14.(23)(c) of the GA Solid Waste Management Rules, this ASD along with the previously submitted ASD for calcium at GWC-19 (Golder, 2021b) addresses each of the SSIs noted following the August 2021 sampling event.

Based on the data presented herein, SSIs from the August 2021 monitoring event are not the result of a release from the lined landfill unit, but rather natural variability in groundwater quality. The lines of evidence include:

- The reported concentrations of calcium and nickel are within the range of concentrations expected in the regolith – fractured bedrock aquifers in the Piedmont of southeastern US (USGS, 2009; USGS, 2013).
- Boron, a primary indicator parameter for CCR, is not present above the method detection limit (<0.060 mg/L) at GWC-2.
- Based on the February 2022 results, neither the concentrations calcium at GWC-19 nor nickel at GWC-2 represent confirmed SSIs.

Based on the findings presented herein, Georgia Power will continue with detection groundwater monitoring at Cell 1 and PAC Ash Cell. A copy of this ASD will be included with the forthcoming Annual report.

Comments

No additional comments.

Receipt

The samples were received on 2/17/2022 9:30 AM and 2/21/2022 9:30 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 4 coolers at receipt time were 3.2° C, 3.6° C, 4.1° C and 8.7° C.

Receipt Exceptions

The container label for the following sample did not match the information listed on the Chain-of-Custody (COC): GWC-3 (180-133869-3). The container labels list a sample id of GWC-15, while the COC lists GWC-3. The collections times matched therefore the ID on the COC was used.

The following samples were received at the laboratory outside the required temperature criteria in one cooler (8.7°C): GWC-13 (180-133984-3), GWC-14 (180-133984-4), GWC-19 (180-133984-6) and GWC-20 (180-133984-7). This does not meet regulatory requirements. The client was contacted regarding this issue, and the laboratory was instructed to proceed with/cancel analysis.

GC Semi VOA

Method 300.0: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 180-388878 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Field Service / Mobile Lab

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Definitions/Glossary

Client: Southern Company
Project/Site: Plant Scherer Cell 1

Job ID: 180-133869-1

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Accreditation/Certification Summary

Client: Southern Company
Project/Site: Plant Scherer Cell 1

Job ID: 180-133869-1

Laboratory: Eurofins Pittsburgh

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

Georgia Registered Professional Engineer No. 047845

1.0 INTRODUCTION

This alternate source demonstration (ASD) has been prepared on behalf of Georgia Power Company (Georgia Power) by Golder Associates USA Inc., a member of WSP (WSP Golder), in accordance with 40 CFR § 257.94(e)(2) of the Federal Coal Combustion Residuals (CCR) Rule and § 391-3-4-.14(23)(c) of the Georgia (GA) Solid Waste Management Rules to address the statistically significant increases (SSIs) of constituents over background concentrations.

These SSIs were reported in the *2022 Semi-Annual Groundwater Monitoring and Corrective Action Report* dated August 31, 2022, for the February 2022 semi-annual groundwater sampling event at Georgia Power's Plant Scherer (Scherer) Cell 1 and Powdered Activated Carbon (PAC) Ash Cell (Golder, 2022). Within 90 days of the reported SSIs in compliance with 391-3-.14, this report describes an alternate source for the reported SSIs and demonstrates that the SSIs are not the result of a release from Cell 1 or PAC Ash Cell, but rather due to natural variability in groundwater chemistry.

Semi-annual groundwater quality monitoring and reporting for the landfill units at Plant Scherer are performed in accordance with the Solid Waste Permit 102-009D(LI); and the *Groundwater Monitoring Plan Narrative of the Design & Operations Plan for Georgia Power Company's, Plant Scherer CCB Disposal Facility*, prepared by Southern Company Generation Engineering and Construction Services, February 26, 2010 and the CCR Rule 40 CFR § 257.90-98. The following sections address the statistical exceedances noted following the 2022 first semi-annual monitoring event and provides evidence that demonstrates an alternate source for these exceedances.

2.0 SITE DESCRIPTION

Plant Scherer is a coal-fired power generation facility located in northeast Monroe County approximately 5 miles south of Juliette, GA. The property occupies approximately 13,000 acres and is bounded on the south by Lake Juliette. The plant is primarily surrounded by agricultural and residential use. Figure 1 depicts the location of Plant Scherer relative to the surrounding area.

The Plant Scherer Landfill consists of a two active cells, namely, Cell 1 and PAC Ash Cell (Figure 1). The two active cells have been utilized since 2011 for the disposal of CCR. Figure 2, depicts the general configuration of the Cell 1 and site monitoring wells along with the potentiometric surface from February 2022.

The site is located within the Piedmont Physiographic Province of central Georgia, which is characterized by gently rolling hills and narrow valleys, with locally pronounced linear ridges (Golder, 2021a). Overall, the property slopes gently south towards Lake Juliette and east toward the Ocmulgee River (Figure 1). The landfill is situated east/southeast of the ash pond which is in a topographically high area on the property. The landfill cells have a geosynthetic clay liner and a geomembrane, and a leachate collection and removal system.

3.0 EVALUATION OF ANALYTICAL RESULTS & STATISTICAL ANALYSES

As presented in the 2022 *Semi-Annual Groundwater Monitoring and Corrective Action Report*, analytical results show that concentrations of target constituents are below the established prediction limits (PLs) in groundwater samples collected during the February 2022 sampling event with exception of barium and sulfate at GWC-4 and calcium at GWC-8A. Verification samples to confirm barium and sulfate concentrations at GWC-4 were collected May 12, 2022, and statistical exceedance were confirmed. Table 1 presents a summary of the February 2022 monitoring results.

An Alternate Source Demonstration (ASD) has been prepared to address the SSIs over background. Table 2 summarizes the statistical exceedances following the February 2022 sampling event, the upper PLs, and whether each statistical exceedance is verified from the previous (August/September 2021) event or an initial control limit exceedance. The SSI for calcium at well GWC-8A is a verified exceedance, whereas the SSI for sulfate at well GWC-4 and for barium at well GWC-4 is an initial exceedance.

3.1 Statistical Analysis Method

The selected statistical method for Cell 1 and PAC Ash Cell was developed using methodology presented in *Statistical Analysis of Groundwater Data at RCRA Facilities, Unified Guidance*, March 2009, USEPA 530/R-09-007 (Unified Guidance). The Sanitas groundwater statistical software was used to perform the statistical analyses. Sanitas is a decision-support software package that incorporates the statistical tests required of Subtitle C and D facilities by United States Environmental Protection Agency (USEPA) regulations and guidance as recommended in the USEPA Unified Guidance (2009) document.

During detection monitoring at the site, groundwater quality data are evaluated using a two-step statistical approach (i.e., intrawell followed by interwell PLs). The statistical method(s) use an optional 1-of-2 verification resample plan. An initial exceedance occurs when any downgradient well data exceed both intra- and inter-well PLs.

4.0 ALTERNATE SOURCE DEMONSTRATION

In accordance with Rule and § 391-3-4-.14(23)(c) and 40 CFR § 257.94(e)(2), the following discussion provides a demonstration that the SSIs identified following the February 2022 sampling event are not the result of a release from Cell 1 or the PAC Ash Cell.

4.1 Calcium (GWC-8A)

An ASD for calcium at GWC-8A was previously submitted (Golder, 2021b). The concentration of calcium at GWC-8A for the February 2022 event is similar to historical concentrations as shown in Figure 3; therefore, the previously submitted ASD is still applicable. The calcium concentration at GWC-8A for the February 2022 sampling event is 49 milligrams per liter (mg/L), which is slightly above the upper prediction limit (UPL) of 45.47 mg/L. During the subsequent sampling event in August 2022, calcium at GWC-8A was reported at 39 mg/L which is below the PL (Figure 3a). As shown on Figure 3b, an inverse relationship is observed between calcium and sulfate. This further substantiates that natural variability is the source of the observed calcium concentrations in groundwater at the site, as impacts from Cell 1 would demonstrate a calcium sulfate (gypsum) chemistry. General chemistry at GWC-8A compared to upgradient groundwater monitoring wells is shown on a piper trilinear diagram presented as Figure 4. Review of the piper diagram shows that GWC-8A plots consistent with upgradient groundwater quality and does not suggest influence of another source (i.e., Cell 1). The variations in

calcium in groundwater at GWC-8A are due to natural variations in groundwater quality related to mineral saturation and solubility.

4.2 Barium and Sulfate (GWC-4)

The concentration of barium at GWC-4 for the February 2022 event is similar to historical concentrations as shown in Figure 5. The barium concentration at GWC-4 for the February 2022 sampling event is 0.055 mg/L, which is slightly above PL of 0.051 mg/L. A subsequent sample taken in May 2022 has the concentration of barium at 0.060 mg/L while the August 2022 concentration decreased to 0.054 mg/L. The variations in barium in groundwater at GWC-4 are due to natural variations in groundwater quality related to mineral saturation and solubility. Barium concentrations at well GWC-4 are comparable to the reported range of barium concentrations (0.02 to 0.12 mg/L) in the crystalline rock aquifers of the Piedmont. Naturally-occurring minerals such as barite are fairly common in the Piedmont and barite is easily dissolved under most geochemical conditions (USGS, 2013).

The sulfate concentration at GWC-4 for the February 2022 sampling event is 20 mg/L, and for the May 2022 resample it is 33 mg/L. Subsequent sampling during August 2022 reported a concentration of 19 mg/L. Each of these concentrations are above the PL (6.29 mg/L). Figure 6 shows a time line trend of sulfate concentrations at GWC-4 as well as site wide sulfate concentrations. While the February 2022 concentration are elevated compared to historical values, the recent reported concentration (19 mg/L) is within the range observed across the site and is within range (12 - 29 mg/L) for fractured bedrock aquifers in the Piedmont of southeastern US (USGS, 2013). General chemistry at GWC-4 compared to upgradient groundwater monitoring wells is shown on a piper trilinear diagram presented as Figure 7. Review of the piper diagram shows that GWC-4 plots consistent with upgradient groundwater quality and does not suggest influence of another source (i.e., Cell 1).

Boron and chloride and primary indicator parameters in groundwater flow through CCR units (e.g. Ruhl 2014). Boron is not present at GWC-4 above the method detection limit (<0.060 mg/L, Figure 8a) throughout the monitored history and chloride concentrations at GWC-4 are stable and do not indicate any trend (Figure 8b). If the SSIs of barium or sulfate were due to a release from the landfill we would expect to see an increase in multiple indicator parameters, notably boron and chloride, which is not observed. The increase in barium and sulfate concentrations at GWC-4 are attributed to natural variations in groundwater chemistry.

5.0 CONCLUSIONS

This ASD has been prepared in response to apparent statistical exceedances presented in the *2022 Semi-Annual Groundwater Monitoring and Corrective Action Report, Georgia Power Plant Scherer Cell 1 and PAC Ash Cell, Permit No. 102.009D(LI)*, dated August 31, 2022. In accordance with 40 CFR § 257.94(e)(2) and §391-3-4-.14.(23)(c) of the GA Solid Waste Management Rules, this ASD along with the previously submitted ASD for calcium at GWC-8A (Golder, 2021b) addresses each of the SSIs noted following the August 2022 sampling event.

Based on the data presented herein, SSIs from the August 2022 monitoring event are not the result of a release from the lined landfill unit, but rather natural variability in groundwater quality. The lines of evidence include:

- The reported concentrations of calcium, barium and sulfate are within the range of concentrations expected in the regolith – fractured bedrock aquifers in samples from the Piedmont of southeastern US (USGS, 2009; USGS, 2013).

- The chemical composition of groundwater in well GWC-8A is similar to upgradient groundwater (Figure 4). As such, calcium concentrations in groundwater in GWC-8A are controlled by the natural mineral content in the aquifer materials and not a result of a release from Cell 1.
- Based on the August 2022 sample results, the concentration of calcium at GWC-8A does not represent confirmed SSIs.
- Calcium and sulfate have an inverse relationship in GWC-8A (Figure 3b) that is not representative of a release from Cell 1. Further a downward trend for sulfate is present at monitoring well GWC-8A.
- Based on major relative ion abundance (Figure 7), groundwater from GWC-4 is similar to upgradient well results and does not appear to suggest a release from the landfill unit.
- Boron, a primary indicator parameter for CCR, is not present above the method detection limit (<0.060 mg/L) at GWC-4. Barium and sulfate represent the only SSIs for GWC-4; no other primary indicator parameters for CCR exceed the prediction limits at well GWC-4.

Based on the findings presented herein, Georgia Power will continue with detection groundwater monitoring at Cell 1 and PAC Ash Cell. A copy of this ASD will be included with the forthcoming Annual report.

- NOTES:**
1. mg/L - Milligrams per Liter; SU - Standard Units.
 2. < indicates the substance was not detected above the analytical method detection limit (MDL). The value displayed is the MDL.
 3. J indicates the substance was detected at such low levels that the precision of the laboratory instruments could not produce a reliable value. Therefore, the value displayed is qualified by the laboratory as an estimated number.
 - 4 * indicates the analyte was resampled on May 12, 2022. Both the February and May 2022 sample results are shown.

TABLE 2
SUMMARY OF STATISTICALLY SIGNIFICANT INCREASES - FEBRUARY 2022
 Georgia Power Company - Plant Scherer
 Juliette, Georgia

WELL ID	CONSTITUENT	Concentration (February 2022)	Intrawell Prediction Limit	Interwell Prediction Limit	SSI (Initial / Verified)	ASD Previously Submitted
		mg/L	mg/L	mg/L		
CELL 1						
GWC-8A	Calcium	49	45.47	14	Initial	YES ^[1]
GWC-4	Barium	0.055	0.05378	0.051	Initial	No
GWC-4	Sulfate	20	6.288	3.1	Initial	No

Notes:

[1] Alternate Source Demonstration Georgia Power Company – Plant Scherer Cell 1 and PAC Ash Cell Permit No. 102.009D(LI) 2021 First Semi-Annual Monitoring Event, November 19, 2021 (Golder, 2021b).

During the subsequent sampling event in August 2022, calcium at GWC-8A was reported at 39 mg/L which is below the PL (Figure 3a).

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: Southern Company
Project/Site: CCR - Plant Scherer Cell 1

Job ID: 680-220259-1

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
^+	Continuing Calibration Verification (CCV) is outside acceptance limits, high biased.
^6+	Interference Check Standard (ICSA and/or ICSAB) is outside acceptance limits, high biased.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
B	Compound was found in the blank and sample.
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
*+	LCS and/or LCSDB is outside acceptance limits, high biased.
H	Sample was prepped or analyzed beyond the specified holding time

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Eurofins Savannah

Job ID: 680-220259-1

Laboratory: Eurofins Savannah

Narrative

Job Narrative 680-220259-1

Receipt

The samples were received on 8/26/2022 9:00 AM and 8/27/2022 9:00 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 9 coolers at receipt time were 0.4°C, 0.5°C, 1.6°C, 2.4°C, 2.7°C, 2.7°C, 2.9°C, 5.7°C and 5.8°C

HPLC/IC

Method 300_ORGFM_28D: The method blank for analytical batch 180-410671 contained Fluoride above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals

Method 6020B: The continuing calibration verification (CCV) associated with batch 180-412385 recovered above the upper control limit for antimony. The samples associated with this CCV were non-detects/batch QC for the affected analytes; therefore, the data have been reported. The associated samples are impacted: (CCV 180-412385/151) and (LCS 180-412195/2-A).

Method 6020B: The continuing calibration verification (CCV) associated with batch 180-412391 recovered above the upper control limit for boron. The samples associated with this CCV were batch QC for the affected analytes; therefore, the data have been reported. The associated samples are impacted: (CCV 180-412391/86), (180-143834-J-1-C MSD) and (180-143834-J-1-A PDS).

Method 6020B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 180-412195 and analytical batch 180-412385 were outside control limits for multiple analytes. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

Method 2320B: The following samples were analyzed outside of analytical holding time due to mechanical and technical difficulties GWA-17 (680-220259-1), GWC-1 (680-220259-2), DUP-4 (680-220259-3), GWC-2 (680-220286-1), GWC-13 (680-220286-3), GWC-14 (680-220286-4) and EB-5 (680-220286-5).

Method 2320B: The lower laboratory control sample (LLCS) for analytical batch 180-411525 recovered outside control limits for the following analytes: Alkalinity . These analytes were biased high in the LLCS. All samples associated with this LLCS were either ND or contained results greater than 20 mg/L ; therefore, re-analysis of samples was not performed.

Method 2540C_Calcd: Reanalysis of the following sample was performed outside of the analytical holding time due to conductivity being too different compared to the Total Dissolved Solids (TDS) : EB-4 (680-220282-16).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Sample Identification	Sample Date	Sample Time	Sample Type (C=Comp, G=Grab)	Matrix	# of Cont.	Filtered Sample (Y/N)	Perform MS/MSD (Y/N)	Cations: Na, Mg, K	Alkalinity (total, CO3, HCO3)	Sample Specific Notes
GWC-2	8/26/2022	8:56	G	WG	4	N	N	X	X	pH= 6.37
GWC-12	8/26/2022	9:51	G	WG	4	N	N	X	X	pH= 5.07
GWC-13	8/26/2022	8:45	G	WG	4	N	N	X	X	pH= 5.91
GWC-14	8/26/2022	9:25	G	WG	4	N	N	X	X	pH= 5.51
EB-5	8/26/2022	9:40	G	WQ	4	N	N	X	X	

Preservation Used: 1=Ice, 2=HCl, 3=H2SO4, 4=HNO3, 5=NaOH, 6=Other

Possible Hazard Identification: Please List any EPA Waste Codes for the sample in the Comments Section if the lab is to dispose of the sample

Non-Hazard Flammable Skin Irritant Poison B Unknown

Return to Client Disposal by Lab Archive for _____ Months

Special Instructions/QC Requirements & Comments:

Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)

Custody Seal No: 14:20
Company: USA-60092
Date/Time: 08/24/22

Relinquished by: [Signature]
Date/Time: 8-26-22

Relinquished by: [Signature]
Date/Time: 8/27/22 9:00

Relinquished by: [Signature]
Date/Time: [Blank]

Question	Answer	Comment
Radioactivity wasn't checked or is \leq background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <math><6\text{mm}</math> (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A
